now thts very interesting,

I'd love to see a MPPT charger that is tiny and small. has anyone?

4877. 167 flights this year

Yahoo group: GPSL (2009 — 2010)
Date: 2009-01-02 01:02:21 UTC
From: K. Mark Caviezel
Topic: 4877 Message: 4877

167 flights, about 5 were plastic (zero pressure, solar, and super pressure).
THANKS AGAIN to Ralph for keeping the stats on this sport!

I'm wondering, what sort of payload, altitude and price point for a zero pressure floater would be of interest to the ARHABians?

Point of reference: The SNOX 4 balloon was 920 cubic feet, suitable for 12 pounds to about 39k feet and small run production cost about $200, not significantly different in cost from a 2000 g or 3000 g latex balloon. This balloon flew for over 40 hours and over 3300 miles.

If there is interest, I may make a small production run of small ZP floaters.

best regards,

- Mark Caviezel ng0x

167 flights, about 5 were plastic (zero pressure, solar, and super pressure).
THANKS AGAIN to Ralph for keeping the stats on this sport!

I'm wondering, what sort of payload, altitude and price point for a zero pressure floater would be of interest to the ARHABians?

Point of reference: The SNOX 4 balloon was 920 cubic feet, suitable for 12 pounds to about 39k feet and small run production cost about $200, not significantly different in cost from a 2000 g or 3000 g latex balloon. This balloon flew for over 40 hours and over 3300 miles.

If there is interest, I may make a small production run of small ZP floaters.

best regards,

- Mark Caviezel ng0x

Search this forum and the other Yahoo ARHAB ballooning forums (Balloon_sked, Balloonatics, Ballooning, etc.) for posts from WB8ELK. Bill has been doing this for some time, using an encoder of his own design based on the Cypress PSoC Mixed signal mode processor. It also does RTTY (FSK and AFSK) and DominoEX. He may be flying such a payload next Saturday (1/10/09) if the weather cooperates. I just posted a similar reply to a question about Hellscreiber on the Opentracker forum, relating Bill's recent flights using Hellscreiber. It has a few more details on his payload.

Check out this site...

http://web.mit.edu/bgelb/www/balloon/hfbeacon/

I would bet that they would have some info for you if you
write the guys that put up the page.

From: wb8elk@aol.com
Topic: 4880 Message: 4886

Hi Mark,

I'm working on the latest version of my Hellscreiber Balloon board....it also does CW, RTTY and DominoEX.

It's working great on my workbench and now has a GPS module mounted directly on the board....it's a new one made by a company called Inventek and is less than the size of a quarter....so far it's picking up 9 satellites inside my house. It's a SIRF III chipset but as far as I know it may be the only SIRF III chipset that works above 60k feet...they have modified the code to work up to 135,000 feet specifically for balloon flights.

I'll be flying it this weekend.

I'll be posting my Hellscreiber details (as well as the other modes) on my website in a few days under the PROJECTS tab.

http://www.wb8elk.com (http://www.wb8elk.com)

I'm currently doing everything with the Cypress PSoC microcontroller...but also have it working on the Arduino board (Atmel AVR Mega168 with special bootloader that allows serial programming without the programming dongle). I'll post both versions this week on the website.

- Bill WB8ELK

4889. Re: [GPSL] Hellschreiber beacons for balloons - WB8ELK website link

Yahoo group: GPSL (2009 — 2010)
Date: 2009-01-06 00:18:14 UTC
From: wb8elk@aol.com
Topic: 4889 Message: 4889

Mark and all,

I just updated my website to include a PROJECTS section that will shortly include the Hellscreiber and RTTY transmitter.

http://www.wb8elk.com (http://www.wb8elk.com) click on the PROJECTS link.

Right now it's showing the 434 MHz CW transmitter (both Keyed and AM modulated versions) that uses the SparkFun 8 milliwatt transmitter module controlled by the Arduino Stamp (also available on SparkFun). It's the subject of my next balloon column "Up In The Air" in the Winter 2009 CQ VHF magazine.

The Arduino has a built-in bootloader that allows you to code in C and program it with the free Arduino software using a serial interface (USB or RS-232).

Note that you can key an HF clock oscillator (10m or otherwise) using the same circuit instead of the SparkFun 434 MHz module using a FET or transistor to key the clock oscillator on/off ... no keying transistor necessary if the clock oscillator has an on/off control line.

In the next day or two, I'll post the Hellscreiber and RTTY code using the same circuit.

Also, I'll be posting the details (when I get the chance to clean up the program to make it readable) for the Cypress PSoC multi-mode beacon that does CW, RTTY, Hellscreiber and DominoEX (both SSB and FM modes on any band).

- Bill WB8ELK

Hi Ron,

I'll be making up boards as kits for those interested as soon as I do a couple of test flights....I can offer them as assembled and tested too....I'll let you know when I have it finalized.

4893. 2008 Taylor University flights

Yahoo group: GPSL (2009 — 2010)
Date: 2009-01-06 18:12:58 UTC
From: Ralph Wallio, W0RPK
Topic: 4893 Message: 4893

Thanks Jeff --

You folks have a significant flight program that we would like to regularly include in our ARHAB
Launch Announcements, Records and flight counts. Your information adds 7 flights for a collective
total of 174 known ARHAB flights which break down to 96 flights by educational institutions and 78
flights by Ham Radio groups.

I noted your posting to the GPSL list dated 01Oct08 and, after returning home from a vacation,
responded with questions on 08Oct08 about launch locations and downlink information. I did not
receive a response.

You are welcome to post flight announcements directly to me, to GPSL and/or to Balloon_Sked. We
need more precise launch location and downlink information than you have included. It would help us
in several ways if you folks supported a Taylor University HAB web site.

Ralph

Taylor had seven launchs that you missed on your totals they were sent to the GPSL list on 10/1/08

Taylor launchs in October:
9/30 HARP84 10:00am Launch site IN.
10/10 HARP85 7:30pm Night flight Launch site IN.
10/11 HARP86 10:00am Astronomy1 Launch site IN.
10/24 CCLI1 10:00am Launch site IN.
10/25 CCLI2 10:00am Launch site AR.
10/30 CCLI3 10:00am Launch site WA.
11/1 CCLI4 10:00am Launch site MN.

All flights had APRS on KB9ZNZ-1 or 11

4898. BASE 32 - Go for Saturday

Yahoo group: GPSL (2009 — 2010)
Date: 2009-01-08 18:44:01 UTC
From: BASE
Topic: 4898 Message: 4898

Dear friends,

BASE 32 is go for flight on Saturday, 10 January. Launch from DePauw in Greencastle, IN at 16:00 UTC. Landing projected near the Indiana/Ohio border south of Richmond, IN around 18:00 UTC. APRS beacon, W9YJ-11 on 144.39 MHz. Primary downlink on 900 MHz Spread Spectrum. Experiments selected and developed by students that started class this past Monday. We'll be flying video cameras, solar cells, phototransistors with polarizers, and sample of environmentally friendly fluids that may be used on future flights.

Launch day forecast features temperatures near 0 Celsius (32 F) with winds of 30 km/hr (18 mi/hr).

Howard

Pretty neat story about NASA's mondo superpressure balloon test flight, ultimately capable of 2200 lb neck loads up to 110K'. And it floats there without having to dump ballast. The hard part is making the envelope strong enough to tolerate overpressure without making it a lead balloon.

4904. Re: [GPSL] NASA super pressure

Yahoo group: GPSL (2009 — 2010)
Date: 2009-01-13 01:21:32 UTC
From: Luis Eduardo Pacheco
Topic: 4903 Message: 4904

Good point. Here in my country we have a saying. The more accurate translation is that "the better is good's foe".

After the launch failure (due to a bad inflation tube) occured during the Fort Sumner fall campaign the next opportunity was to launch from McMurdo in the 2008/2009 campaign. Taking account of the past failures, the fact of having flying the thing for more than 10 days -althought it's not the ideal environment test- become fresh air for the program. Really better than to not to fly at all ¿isn't?.

Greetings from the south of the blue ball.

4905. BASE 32 flight complete

Yahoo group: GPSL (2009 — 2010)
Date: 2009-01-13 22:00:59 UTC
From: BASE
Topic: 4905 Message: 4905

Dear all,

The BASE 32 flight was a success. Launch at 16:20 UTC from DePauw campus (39.64 North, 86.86 West) by a rookie crew in 20 mph winds. Average ascent rate of 1470 feet/min. Burst at 17:18 UTC 85,000 feet. Landing at 18:02 UTC at 39.774 degrees North and 85.055 degrees West longitude. Flight heading 84 degrees from launch to landing. Great circle distance 97 miles.

Recovery made by Justin Munger, W1IX.

Excellent realtime flight data from student experiments.

Details to follow on the website: www.depauw.edu/acad/physics/base

BASE 33 is still on schedule for Saturday 17 January.

Howard

As far as today the ULDB is traveling over the East Antarctic Plateau at an altitude of 110.700 feet. According to NASA sources both altitude and differential pressure have continued to remain steady.

The flying pumpkin has been 16 days until now aloft.

Greetings

4910. Re: [GPSL] NASA deploys huge clingfilm strato-pumpki n over Antarctic • The Register

Yahoo group: GPSL (2009 — 2010)
Date: 2009-01-14 14:06:56 UTC
From: Luis Eduardo Pacheco
Topic: 4902 Message: 4910

An Antarctic mission -as correctly pointed another person in this same list- is a tricky flight for a superpressure because the balloon receives 24 hours of sunlight plus the reflection from the snow surface. No night-day transitions. As a comparation a well ballasted zero pressure balloon cruised three times around the pole duirng the record braking flight of 42 days in 2004. See it at http://stratocat.com.ar/fichas-e/2004/MCM-20041216.htm

Nevertheless, the succesfull flight is a lot of fresh air for the project after several failures in the past. Hope this new design overcome the past glitches and at last NASA would acomplish the 100-days-big-payload-no ballast-at-mid-latitudes- goal for the ULDB.

Best regards

Luis,

You seem to be well connected with these missions down there. Do you have anything to do with them. Or simply an interested by-stander like most of us?

The later... I'm in South America, more preciselly Argentine Republic.

I'm a kind of "balloon-freak" :-)

Yes, no day/night transitions would sure be nice! That's of course what limits our amateur ZP flights. Have to drop a lot of ballast at sunset. Our SNOX series had enough battery power to last 5 days, but the system had to drop all 6lbs of ballast on the first sunset. Amateurs need more data publicized on this subject, ZP balloons on multi-day flights don't need to be million-dollar missions, we did 5 of them for about $400 a mission, with $200 polyethylene 920 cu ft ZP balloons from Global Western, and hf transmitter/flight computer made by our team WA4ADG, KJ4Z and K2VOL. Now with FindMeSpot, you don't even have to use a worldwide network of hf tracking stations as we did, though telemetry won't go over findmespot. We intend to release our data for others to learn from, though we'll probably wait till we land on dry ground in Europe, or are sure we're done trying. But to those waiting for the secret formula, we've done lots of meticulous tests on the ground and many in the air to perfect our design, and still this kind of system doesn't have a simple recipe. After crossing 90% of the Atlantic, we are left with more unknown variables than we ever thought possible in the beginning. I think amateurs can master small ZP flight, but I believe it will require a lot more ground tests and more sensors on the balloon envelope itself to truly understand what is going on with the balloon envelope itself.

Thanks,
Dan Bowen

Just a note of a test we've been running up here.

Like Dan we too may try this year, if things get better financially here for me.

But our design we too want to keep secret till we make it across also, but it is very different than any other projects the rest long flight gang here has tried.

The heart was,, or i should say IS still a latex balloon.

I know everyone says it'l rott too soon,, Man I know that what everyone says, even the maker of the balloons,, but i beg to differ..

I have balloon shards from our first flight of 20 years ago,, it's yes badly discolored,, it's turing Pink of all colors, but it is still tough as hell! You can stretch it like crazy,, or make a bubble and squeeze it till it's almost transparant, and it still won't pop.

And a test that is into it's 6th week,

I have a 5/8ths wave vert made from alunmum fencing wire tethered out back, hung by a ta 300.

it's gone through some nasty winds and snow storms, but right now it'sa still flying up there,, kinda fun too! this weekend will be the 6th week it's been airborne.

soo,,,

Ok, Rodger,, are you on this list? I've been e mailing you for a week or so and no bounce but no reply either..

Hi Joe and Dan and all,

I'm going to go a different approach and my designs and test results will be Open-Source on my website (my New Year's resolution is to work on that more frequently - I've added a Projects section which will have my designs on them).

I've done quite a number of zero pressure flights over the years but all but a flight with Global Western's 299 cubic footer were quite large (56k cubic feet and up).

I too have an HF transmitter design that's doing well in flight tests...next flight will be this weekend (HF transmitter design, but this week I'm putting it on 2m to make the antenna short to keep ozonesonde folks happy during launch). I'll be posting that info on my website under the Projects tab in about a week after the next flight testing is done.

My trans-Atlantic attempts will begin in February....using Global Western's small ZP envelope. I also may try a valved latex balloon with ballast to see how far I can get with that as well and plan to float that around 60k feet....Joe is right....at sea level, a latex balloon can last quite a while...although humidity and heat can really add to the degradation during the Summer, so Winter is a good time to test that out. The UV environment is much worse in the stratosphere so degradation occurs much quicker than at sea level....so as long as you keep your latex balloon flying below the tropopause, I believe it possibly may last a day or two or more in flight. Most of my long duration latex flights (up to 21 hours) have been at night. Space Data regularly flies 8 hour latex missions during the daytime...but they have a special UV-resistant formulation in their custom-made latex balloons that they manufacture in-house. I don't believe they offer them to the public.

Of course, the ideal place to fly a multi-day latex flight is the exact opposite of that Superpressure balloon in the Antarctic...you'd want to fly a multi-day latex balloon in the Arctic now with continuous darkness.

- Bill WB8ELK

Hi Bill,

My design, I'll probably share, as soon as i get the Ok to do so from
where i got it from.

The original agreement i had with him was it was to be kept a secret.

But if he allows me to release it, i probably will i just don't have
again the time this winter to do this balloon.

Dan,

balloon data gathered by NASA should be in the NASA lighter-than-air library in Virginia (i think).
It is open to all American Citizens. Since US tax payers paid for the data they have access to it.

I've met some of these scientist. They live this stuff and would like to see it go somewhere useful other than the library shelf.

Some Military info is not public but it is extremely dated and most everything has been repeated by NASA or others.
No it isn't on wikiapedia but then foreign enemies could us it if it was.

There are commercial balloon companies out there, and most of their starting info came from the NASA Library.
But what they develop themselves usually is related to the niche market they chase not what hobbyist chase.

Good to hear from you Dan. Tell everyone in Knoxville hi for me.

Sincerely,
Carlton Corbitt

Hey! That's the ticket for a long-duration ARHAB flight! Launch from either pole during the winter. It'll just orbit the pole, and by 'n by, come back near overhead! Go for it, Bill, but be sure to bring yer wollies :=}.

Well, Having watched hysplit daily for 2 years now, it would be
possible to get a balloon up to the arctic in 1.5 days, at least from
TN. Then you could just cruise around over to Russia and back!

Thanks,
Dan

Russia and Back ?

NASA is negotiating since 1998 with them an overflight agreement, but not succeded yet. During a campaign in those years they launched a balloon around the pole from Fairbanks and flew it succesfully around the pole, almost completing a full circle. The next year the agency deployed teams again there and after preparations they where flight ready just waiting for flight clearance from Russia. The authorization was denied and all the operation was cancelled.

Since then the only flight possible around the pole in arctic regions is a summer flight from Svalbard:
http://stratocat.com.ar/fichas-e/2006/LON-20060614.htm which assure not to flight over Russian territory.

Best regards

4924. multi-day flight over poles Re: [GPSL] NASA deploys huge clingfilm strato-pumpkin over Antarcti

Yahoo group: GPSL (2009 — 2010)
Date: 2009-01-16 18:12:01 UTC
From: K. Mark Caviezel
Topic: 4924 Message: 4924

The multi-day SNOX 4 flight from Knoxville to almost Ireland really got me thinking. You could probably better the ARHAB endurance record set by that flight by using an air-filled solar balloon launched in the polar regions. I've had some dialog and interest with Fairbanks, Alaska hams, and some antarctic scientists, but we haven't yet put an effort together.

For those of you who haven't seen it, here is the slow moving launch video of my last solar balloon:
http://www.youtube.com/watch?v=XQfRX3pFnV0
which flew about 400 miles in 14 hours and successfully demonstrated radio-commanded ballast jettisons which raised the float altitude from 52k feet to 55k feet.

The TVNSP group has an identical balloon, but I haven't heard when they're planning to fly it.

Solar balloons are the most finicky to launch, whereas filling and launching a latex balloon can be done at up to 10 mph surface wind, helium filled plastic balloons up to 4-5 mph, I'd suggest maybe 2-3 mph maximum to launch a solar balloon. And unlike a latex balloon that usually climbs at around 1000 fpm, a solar balloon will often depart at 100-200 fpm, so you need to be very careful of the nearest downwind obstacles.

best regards,

- Mark ng0x

4925. BASE 33 completed today

Yahoo group: GPSL (2009 — 2010)
Date: 2009-01-18 01:44:03 UTC
From: BASE
Topic: 4925 Message: 4925

Dear friends,

BASE 33 was completed today (up again, down again, home again). We always have a lot of fun, even in the cold and wind.

Launch was exciting by another rookie cred with steady 20 mph winds and occasionally 30+ mph gusts. As we neared fill on the balloon a strong gust jammed the balloon onto a protuding digit on the hand of one of the balancers. Resulting dime sized hole led to controlled released of the 1200 gram balloon envelope and about 300 cubic feet of helium. We brought out our spare 1200 gram balloon and filled again.

Launch at 16:35 UTC from 40.12 N, 86.91 W.
Ascent rate of 1400 fpm
Burst at 17:35 UTC at 84,700 feet.
Landing at 18:15 UTC at 39.83 N, 84.85 W in Richmond,IN.
Downrange path 111 miles at 112 degrees.

Our 900 MHz landing zone team had a solid location via GPS fix. Complicated streets in the area of a shopping mall prevented them from being at the landing point. As they approached the location, the GPS point began to move at about 4 mph before they lost signal. When they arrived at the last fix, they saw no sign of the balloon. Ron, N9QGS, did some DFing on the 146.565 MHz beacon of Justin, W1IX, and had reached an intersection point in an apartment complex. A resident emerged with our payloads. He kept the balloon remnant and we brought the equipment home.

I believe that the intermittent behavior of W9YJ-11 on APRS might have resulted from interference between the DF beacon and the APRS MicroTrak. Due to the high winds, the two radios were located in separate styrofoam boxes that were taped to each other with only two layers of mylar emergency blanket between them.

I know we have talked about separating transmitters on this list before, but ...

As always more details to follow at:

www.depauw.edu/acad/physics/base

Thanks for your support,
Howard

4927. WB8ELK payload still on Grandpa Mountain in SC

Yahoo group: GPSL (2009 — 2010)
Date: 2009-01-18 07:34:49 UTC
From: wb8elk@aol.com
Topic: 4927 Message: 4927

Hi Mike,

Close but no recovery as yet...since the ground elevation shows 1600 feet and the GPS telemetry is reading 1683 feet....I would assume it's 83 feet up in a tree right at the peak of the mountain...looks like a great RF site....might have to move my hamshack up there!! - Bill WB8ELK

Here's some photos of the new transmitter and flight photos...the new Inventek GPS works great too and works as promised above 60k feet (they claim 135,000 feet)....I've finally found a GPS unit that rivals the venerable GPS-18, the Jupiter and the Motorola units...plus it draws a fraction of the current drain of all of the above units.

http://www.wb8elk.com/oz011709.htm (http://www.wb8elk.com/oz011709.htm)

==========

Eddie WD4JEM and Geri K4GMF drove within 1/4 mile of the payload during the night ... they reported a nearly full-scale signal...in SSB mode they could hear it out to over 15 miles or more... there's a road called Oak Haven Dr. that ended in a forest service type of locked gate (beyond the gate it gets within 200 feet of the payload) but they decided against attempting the hike in the middle of the night ..(Lions and Tigers and Moonshiners, oh my!!)...from the Google Map it looks like a clearing with storage buildings perhaps used by the Forest Service there at Sumter State Park. It looks like there is a hiking trail also that goes within about 50 feet of the payload.

I imagine they might go back in a few weeks when it gets warmer unless someone else braves the cold to retrieve it.

- Bill WB8ELK

This does look like a nice GPS engine at $33, especially if it's less susceptible to RFI. Soldering the 18 SMD pads doesn't look too horrible.

For my main payload I'd have to recode some things which use the PGRMV sentence from the Garmins, which I use to determine ascent/descent.

From: Jeff Dailey
Topic: 4930 Message: 4930

Hello

I started testing the ISM300 last year and had them unlock it for a max altitude of 135K feet, I found it to be very reliable for high altitude balloons.
To date 20 units are flying.

4932. Details on the Inventek GPS unit for ballooning

Yahoo group: GPSL (2009 — 2010)
Date: 2009-01-19 23:01:54 UTC
From: wb8elk@aol.com
Topic: 4932 Message: 4932

Ralph,

You can officially put the Inventek ISMF2-C5.1-V004 GPS module as "passes" for the "GPS receivers vs. 60k feet" list. It worked great (never lost GPS lock) during my last flight to 110,000 feet.

The module itself is very inexpensive but the eval board that Inventek sells is fairly pricey....they have a reasonably priced USB thumb drive eval board version but it's for the F1 and does not bring out serial port B that has the balloon NMEA data on it....therefore, I'm about done with a PC board design that will allow the balloon community to plug and play the board without having to worry about surface mount soldering....I'll offer the board by itself for those with surface mount assembly experience. I'll have that info posted soon on my website: _http://www.wb8elk.com_ (http://www.wb8elk.com) or _http://www.elktronics.com_ (http://www.elktronics.com) I should have that done this week.

The V004 version is the custom firmware build that allows the SIRF III chipset to work up to 135,000 feet....Inventek has one of the SIRF software designers on staff according to info I was told when I called them. Here's the ordering link for the high altitude balloon version:...look for the listing that says "GPS custom firmware" and select the C5.1- V004 version that says, "NMEA 4800, ceiling 135000 ft"

_http://inventeksys.accountsupport.com/store/gps_modules.html_ (http://inventeksys.accountsupport.com/store/gps_modules.html)

This is a very economical unit, to the price point of a disposable system....and they don't mind single quantities.

I flew it with their equally inexpensive active patch antenna (ACTPAT254-01-IP):

_http://inventeksys.accountsupport.com/store/gps_antennas.html_ (http://inventeksys.accountsupport.com/store/gps_antennas.html)

The active patch has a short coax with a UHL connector that plugs directly into the top of the GPS receiver module...you can also run a short PCB trace out from pin 1 to an SMA connector if so desired.

The active patch antenna likes to have a ground plane underneath it for best results...particularly during the acquisition phase....once it's acquired the satellites, it takes a lot less signal to maintain tracking. I put a strip of adhesive metal tape attached to some foam core underneath the patch and it worked great.

The smaller patch antennas they offer will also work, but I would recommend the 254 version (about an inch on a side) since that one seems to be the most sensitive.

So far, I've seen little or no desense by nearby 70cm transmissions, something that only the long discontinued Motorola VP Oncore can do in my experience. It wasn't affected by the ozonesonde signal on 403.2 MHz at all during this last flight...the Trimble Copernicus was affected however. I will test it in an ATV payload soon.

The module operates on 3.3 volts and draws just 25 mA during tracking (add about 10 mA for the active patch)....a big power budget savings over a GPS18 for example...(the GPS18 is 5V at 65 mA). Adding a backup coin cell battery to pin 2 allows you to do incredibly fast hot starts.

Photos of the 2m transmitter board with the onboard Inventek GPS module can be seen here...the same board will work on HF as well with different output filter values.

http://www.wb8elk.com/oz011709.htm (http://www.wb8elk.com/oz011709.htm)

I'll be flying the HF version on 21.091 MHz this weekend (weather permitting).

- Bill WB8ELK

We fly it with a crossband repeater Uplink on 2M and the downlink on 70cm with no problems.

same here with the garmin 18's, not a single problem,, but a 6 MHz wide 1 3 watt sig and it dies.

4935. Re: Details on the Inventek GPS unit for ballooning

Yahoo group: GPSL (2009 — 2010)
Date: 2009-01-20 02:02:46 UTC
From: Steve
Topic: 4932 Message: 4935

Hi Bill -

We haven't met (yet!) - I'm one of the technical weenies with EOSS under Mike Manes - I do GPS at work (aerospace here in Denver). We (EOSS) had one bad case of intermittent GPS desense a while ago that correlated exactly to our UHF ATV cycle - but only when broadcasting the UP-looking scene, not the down-looking scene(!).

The GPS was our standard Motorola Jupiter board, which does have a good BPF ahead of the first active stage on the board - BUT, I had changed out the passive quad helix antenna for a new active patch. The active part of this (and nearly all) patch antenna is a broadband MMIC amp, with NO preselector whatsoever, other than the patch passband itself.

At the close physical proximities of a balloon string, an unshielded MMIC will hear just about everything on the string that talks, esp at UHF. When I removed the MMIC and just had the same patch (now passive) and GPS board, everything cleared up on a subsequent flight.

I suspect many of the UHF-emitter-related GPS desense problems that have been reported are due to the same cause - the GPS board is OK, but the wideband preamp in the active antenna is overloaded and driven into saturation, destroying the GPS signal before it ever reaches the GPS board. With GPS, the delicate phase relationships of the received signals must be preserved for the thing to work right.

EOSS needs to try out the Inventek GPS - sounds VERY promising. Please add us as Beta testers for your board, either populated or not. With the intrinsic sensitivity of SIRF (and given our vanishingly small coax losses), I seriously doubt an active antenna is necessary - and passive patches are CHEAP!

Looking forward to chatting with you on other balloon-related topics - I'll check out your website next!

Tnx - Steve Osborne KC0YA

It's a special software build available from the manuf. It's a
different "model number" than the standard part.

I'm ordering mine tomorrow!

Inverse range squared solves a multitude of EMC problems. This is why we use Zigbee link between the ATV module and GPS module 15 ft away on the payload line to get data to the video overlay.

Hi Mike,

The firmware build C5.1-V004 of the Inventek module already has the altitude limit unlocked up to 135,000 feet....no special commands or configuration necessary if you buy that version....it's plug n play balloon ready.

When ordering make sure to specify that particular module (ISM300F2-C5.1-V004)...it's not the DoD 60k limitation but as they explained it to me, it's a limitation of the Kalman filter algorithm that they use....which they modify to make it work above 78,000 feet (the Kalman filter limit that would be in place without the balloon fix)...the high altitude balloon mod then allows it to work up to 135,000 feet, which is another limit of the Kalman filter. This is probably why the Deluo unit that Byonics sells works up to 78,000 feet but not above (we found that out on the Field Day flight)....but good luck trying to find an engineer at Deluo to modify the code.

I've found that the folks at Inventek are easy to work with and I'd imagine would work with you for specific firmware mods....a conversation with them would be all it would take. It's refreshing to find a company like this...most of the other GPS companies will take you days worth of wading through layers of management and sales people to finally get to an engineer who can answer potential modifications and the answer is usually NO unless you are buying 10,000 units or more (and of course, you'll usually never actually be able to talk directly to the engineer).

Hi Paul,

Sorry to hear about the job time shift. July is very tough month for EOSS for a free weekend. Need to check with a "customer" about moving a previously scheduled flight date. He'll be in on Monday.

Nick

Researchers launch NASA balloon
LAS CRUCES, N.M. (AP) - New Mexico State University researchers have launched a NASA balloon from the McMurdo Station in Antarctica for a record-setting flight.

The university says the balloon is the largest successful single cell super pressure balloon ever flown. It has been flying at an altitude of about 110,000 feet since being launched nearly a month ago.

Researchers say the next generation of super pressure balloons will be able to fly longer missions and carry heavier data gathering instruments.

NMSU's Physical Science Laboratory manages the $238 million NASA contract for the operation, maintenance and engineering support of the Columbia Scientific Balloon Facility.

The facility launches between 15 and 20 balloons each year from sites in New Mexico, Sweden, Antarctica, South American and Australia.

It looks like the weekend closes to the 4th of July weekend, but I need to hear from EOSS.

It also looks like I have permission to use my new school for the meeting. It's the Kaw Area Technical School in Topeka. I have email out to Garmin to see if I can arrange a tour. Is anyone on the list an employee of Garmin?

Would people be able to attend a Garmin tour on Thursday? If the tour takes place on Friday, it would cut into presentations.

I've driven by Kantronics in Lawrence. Perhaps we could take a tour of them, also.

Thnaks,
Paul

Friday, July 3 would be the observed holiday, so I expect Kantronics
and Garmin would be closed on Friday anyway.

I think I'd rather see the Garmin facility instead of Kantronics, but
Olathe is a bit over an hour from Topeka - Kantronics in Lawrence
would be a shorter drive. A late-day tour would be preferred - I
could leave Omaha Thursday morning and head straight to whichever site
we were going to.

From: Nick Hanks
Topic: 4946 Message: 4958

Hi Paul,

As I wrote last weekend, EOSS needed to talk to our sponsoring organization about moving the GPSL date as EOSS had two flights scheduled with them in July. I spoke with them today.

Here's how it lays out for EOSS.

- Nine of the twelve guys we had at GPSL last Aug. participate in Field Day, which is the last weekend in June (fire-up them pace makers). Field Day is basically a two-day event: Friday PM to Sunday afternoon.

- Next weekend is 4th of July. Several families have family events all ready planned. (Wow. I was impressed by that.)

- Next weekend is 11 July. EOSS has a flight planned for a sponsoring organization. The flight is one part of a larger multi-day event that involves folks coming from out of town, facilities already reserved, and basically a schedule that has no flexibility.

- Next weekend is 18 July. No scheduled events.

- Next weekend is 25 July. We have a flight for a sponsoring organization.

If GPSL were to occur on the 4 July our attendance would be down, and we'd stress some families by having folks do ham radio for three weekends in a row, two of which would be multi-day events. So 4th is a non-player for most of us.

If GPSL were to occur on the 25th, we have three consecutive weekends of ham radio, but two weekends would just be a Saturday.

In discussion with our sponsoring organization, they're willing to move the 25th date to 1 Aug. That would give us:

- 26-28 June Field Day

- 4 July Family Time

- 11 July Flight

- 18 July Open

- 25 July Open

- 1 Aug Flight.

How about GPSL the weekend of 18 or 25 July? That would give us only one two-weekends-in-a-row of ham radio. Think we can handle that.

From: Mike Manes
Topic: 4963 Message: 4963

Steve, KC0YA, mentioned that Harbor Freight carries vacuum pumps, primarily intended for air condition system maintenance. This one pulls down to 75 microns (0,075 mmHg or 74 milliTorr), which is WAY higher than 200 Kft MSL pressure altitude - and only $60. There are other higher-power models available at more $$$, but this should do fine with < 1 cuft chamber.

http://www.harborfreight.com/cpi/ctaf/displayitem.taf?Itemnumber=98074

I've seen some homebrew bell jars made from Pyrex and stainless steel mixing bowls. Now, if only we could get cheap mercury manometers ... in a pinch, a surplus Viz radiosonde anaeroid baro pressure mux can serve as a rough altimeter.

4964. Programmable pressure relief valve

Yahoo group: GPSL (2009 — 2010)
Date: 2009-01-27 23:12:01 UTC
From: Dan Wietchy
Topic: 4963 Message: 4964

I'm thinking about putting a programmable pressure release valve in the throat of a future balloon to burp excess helium and keep the balloon at a pre-programmed altitude. Hopefully, it would be programmable via parallax stamp, picaxe or other micro controller.

Has anyone from the balloon groups attempted this and if so, can you provide some reference URL's or other sources for small, light weight and possibly programmable pressure valves.

thanks

Dan KL1JP

Hey, thanks for those links, Steve. I'm cc'ing 'em to GPSL for the rest of the ARHAB gang who may be interested.

BTW, that plastic gasketted refrigerator jar is slick! Kinda small for a full payload, but plenty big enuf for testing pressure-sensitive components. That pump looks just a WHOLE lot like the one from Harbor Freight.

So all we need to do now is pack it with dry ice and we'll have a complete near space simulation chamber. I wonder if that's worth an article? Well, I guess I know what I'm going to spend my money on.

That's a slick system, no doubt. I'd be a little concerned
about putting dry ice inside it though, won't the sublimation
of the dry ice drive the pressure up and limit the simulated
altitude you can reach?

The other concern is if the jar is plastic, dry ice temperatures
might make it brittle and prone to implosion. Or am I being
too cautious?

What we're looking at here is taking a steel tank from an air
compressor, cutting the end off, and welding on some flanges
to allow it to be clamped shut again. Paul, what do you think
about holding dry ice against the outside of this, and having
another layer of insulation over that?

I was thinking of packing the outside of the "bell jar" with dry ice. I agree that placing it inside would lead to pressure increases as the CO2 sublimated. Now, what about embrittling the plastic? I suppose that if the plastic is thick enough, it may not be a problem. Of course one way to find out is to do it and see what happens. I would make a cover of 2" styrofoam to cover the bell jar for insulation and protection.

I would agree that if the plastic was thick, it might not
be an issue. I misunderstood your previous comment on where
the dry ice should go, sorry. I like the idea of a foam shield
that goes over the whole thing, both to insulate it and act
as a barrier if the chamber did crack. There is certainly
nothing to be lost by trying it.

I look forward to the article!

Hi Paul,

Not sure what the CO2 will do to your pump seals, since it forms carbolic acid in contact with water - this is where the "buzz" comes from in carbonated beverages. Might wanna keep the dry ice on the outside of the chamber.

Or you could make your "bell jar" out of pyrex and stainless mixing bowls.

That's what I was planning on. I'll pack the outside of the chamber with dry ice. The other benefit is that the dry ice won't sublimate and become additional gas to be pumped out.

Thinking about last night's finding. The phase diagram shows that CO2 is not stable as a gas or solid at low pressure. So how does Mars retain a CO2 polar cap? Umm, more research is needed.

I see the phase diagram I looked at yesterday doesn't go that low. I can see however, that the solid phase is trending that way.

My students tested the pump last night. It works. I was concerned that since it was Harbor Frieght, it might have a problem. Now to find a bell jar. I'll try the airtight flour containers used on the webpage we were given.

Paul

PS. The pump does not come filled with oil. Be sure you fill it with the vacuum oil they include before you turn it on.

No, CO2 in contact with water forms Carbonic Acid, not Carbolic Acid. Carbolic Acid is a Benzene derivative, and was used as an early disinfectant (e.g., I wouldn't want to drink THAT!).

http://en.wikipedia.org/wiki/Phenol
http://en.wikipedia.org/wiki/Carbonic_acid

> this is where the "buzz" comes from in carbonated
> beverages.

Right. Carbonic Acid, which is basically CO2 dissolved in water, is what gives carbonated beverages their fizziness.

> Might wanna keep the dry ice on the outside of the chamber.

Carbonic Acid is a rather weak acid. It may or may not damage pump seals.

Please use caution when working with vacuums. It's possible for
some (glass) enclosures to shatter if an implosion occurs, and
flying shards are no fun at all. I like to cover my bell jars with
a piece of plastic, just in case the worst happens.

<Not sure what the CO2 will do to your pump seals, since it forms carbolic
acid
<in contact with water..............

Actually, it's carbonic acid not carbolic acid.

H2CO3 for carbonic vs. C6H5OH for carbolic, commonly used as a disinfectant.

Unfortunately, the EOSS chamber is so big that dry ice on the outside probably wouldn't draw out much heat from the DUT. But I've yet to find a component that's sensitive to both low pressure and temperature simultaneously, although no doubt some do exist.

All you have to do next is add a mondo UV light source to make a real solar-vac chamber!

Surface baro pressure on Mars is about 10 mbar - like Earth at 100K' MSL. This is why EOSS has flown some Mars-destined payloads.

Great! Steve KC0YA will be happy to learn that.

Note that all of my machine tools are Chinese-made. They aren't Bridgeport or Hardinge quality, but they get the job done - and they fit my budget (kinda). Chinese products nowadays are similar in quality to Japan's in late 60's & early 70's.

Yeah, I covered the plexiglas chamber with several heavy quilts and hit behind
a wall the first time I pulled it down! The flat sides do deflect at < 10
Torr, but only about 1/8", and they're 5/8" thick. Now I sit next to it.
So far, so good ...

Umm, I hear a challenge.

So let me plan to place UV LEDs inside.

I tried to find some fittings for the tank last night. I want to bolt a threaded port through the wall. I didn't see what I was looking for at ACE (under plumbing). I'll see what I can find at a auto parts house since the pump is used for AC systems.

You might try a batch of Peltier cells. These are used in modern computers for CPU coolers, and they can move quite a bit of heat (e.g., produce quite a low temperature), although they do gobble a bit of power. Make sure the hot side has a good heat-sink for maximum cooling, though.

You can frequently pick them up on e-bay for a not too unreasonable price.

You'd need a BUNCH of them to imitate the sun.

NSSTC center - across from UAH campus in Huntsville AL

Payload: 750 milliwatts on 14.077 MHz USB (center carrier of 14.0785).

In order: RTTY, Feld-Hell, DominoEX (5 baud, 11 baud then 22 baud).

Predicted landing zone: Dalton/Chatsworth GA.

- Bill WB8ELK

Jack...if you're hearing it at 2209z...it's on the ground....hopefully you'll get enough signal to get the final landing spot....it's just east of Chatsworth GA

I was able to copy that 2206z transmission here on ground wave at 5054m altitude...but it was getting pretty weak....DominoEX modes really pulled it in for me.

If you can run MultiPSK...you might try the DominoEX mode 5,11 and 22.....if you can barely hear the signal, you'll still be able to pull in the data with DominoEX.

Anyone else have copy on it?...looks like Arizona has the right skip today.

This absolutely drove me nuts Bill.

All I was hearing on the band was 4 land signals, and STRONG ones like
20 over. Yet I never heard one peep of the balloon.

how weird is that!?

Bill,

I thought the balloon would be down by the time I got home around 3:30pm (2130Z), so I was pleasantly surprised to hear it loud and clear when I turned on my FT-817:

Here are the last DominoEX transmissions I received:

> -WB8ELK/46/215811/3446.88/08447.35/7009.5M/11/2/ eee
> -WB8ELK/46/215811/3446.88/08447.35/7009.5M/11/2/

> -WB8ELK/47/220208/3445.73/08444.71/5054.0M/11/2/
>

It appeared be on its way down, and I lost it quickly around 2208Z.

I have an audio recording of it from around 2140 onwards.

Hi Joe....4-land is pretty large...you may have been copying Florida folks....I think the skip today was 1800 miles or more on 20m....I wish I could've flown a larger antenna to try it on 40m...I really like the day and night propagation on 40m....but 20m was at my limit for attaching to the ozonesonde as a hitchhiker. I'll have to do 40m as a standalone flight from my farm which I can do in February.

4995. WB8ELK balloon payload has been located but is still up in a tree

Yahoo group: GPSL (2009 — 2010)
Date: 2009-02-01 04:51:23 UTC
From: wb8elk@aol.com
Topic: 4995 Message: 4995

Today's flight went up over 92,034 feet (highest good telemetry frame). The GPS received up to 11 satellites during the flight but would sometimes seem to repeat a position lat/lon every once in awhile even though 11 satellites were shown to be tracking.....other than that, good signals were received by line-of-sight ground wave as far as Ohio, NC, GA and AL....Skip conditions on 20m was quite long and the only DX reception report came from Jack W7JLC who copied quite a number of good reports on RTTY and CW from the Phoenix, AZ area over 1800 miles away.

The payload was a 1-watt transmitter with an onboard Inventek GPS receiver with active patch. It ran on 6 AA lithium batteries at around 9 volts and weighed 12 ounces total with a dipole wire antenna (22 gauge wire).

When the signal got weak here just as it was landing, the DominoEX modes really came through with perfect copy even though nothing was being heard on RTTY, Hellscreiber or CW....even the high speed DominoEX22 worked great on weak signals.

The payload landed about 5 miles southeast of Chatsworth GA and has been located by Shane N4XWC, Ron KC7RW and Chris KC4GNX. Since Shane had no HF equipment along with him, he first DFed the ozonesonde 403.2 MHz payload to a ravine south of Fort Mountain GA. After hiking in the wilderness down a steep slope in the middle of the night he turned back and met up with Ron and Chris who managed to decode the actual landing position on the HF telemetry from their mobile rig. It turned out Shane was only 200 feet from the payload in his first DF attempt.

They managed to pull the parachute and balloon shards from the tree but the ozonesonde and the HF payload still are up in the tree.

For those of you who want to try to hear it on 14.077 MHz, it will probably still be transmitting until about noon on Sunday.

Here's some info on the flight and landing site maps:

http://www.wb8elk.com (http://www.wb8elk.com)

Landing coordinates:

34d 43.808 84d 42.019m

I've purchased some of the parts I'll need for the environmental chamber. The plan at this time is to lay the plastic jar on it's side. A pallet containing the test subject and overhead UV LEDs slides in and the lid is closed. The top of the pallet contains a small thermometer and magnetic reed switch for the UV LEDs. The contraption sits in an open box of dry ice and gets pumped down after the temperature drops low enough. As it pumps down, a magnet placed on top of the jar turns on the LEDs. A lid goes over the box to reduce heat loss and to contain parts if it decides to implode.

I'll purchase two different UV LEDs so the spectrum is covered well.

Now to see if I can get someone at KATS to gently drill a hole for me.

Use isoprop or ethyl alcohol as a coolant when drilling plastic. The biggest
risk there is plastic melting from the friction and sticking to the bit.
And keep the chuck speed WAY down!
Got that T-shirt, BTW :={.

4998. My observations of various digital modes for balloon telemetry

Yahoo group: GPSL (2009 — 2010)
Date: 2009-02-03 08:58:29 UTC
From: wb8elk@aol.com
Topic: 4998 Message: 4998

thomas@... writes:

Hello, any one of you made a complete list of all formats
and their goods and bads ?

Thomas,

Here's my observations of the various HF digital modes I've been
experimenting with for ballooning and their merits and data rate.

I'll take an example of one of my recent telemetry frames (RTTY in this
case) during last weekend's flight...this particular RTTY frame was received from
over 1800 miles away by Jack Crabtree W7JLC in Prescott, Arizona (1 watt
transmitter on 14.077 MHz over Dalton, Georgia at the time).

WB8ELK-2Ø:/38/212611/3442.36/Ø85Ø5.51/38/356/1/11/28Ø52.3/8.6Ø/16/15/W

To decode the above sequence:

Callsign/Sequence#/Time(UTC)/Lat/Lon/Speed/Heading/GPSlock/Sats/Altitu
de(meters)/Battery/Board Temperature(C)/Battery Temperature(C)/W = West Longitude

I've been doing nightly tests over a 1200 mile path on 40 meters with an
Internet radio in Connecticut (thanks to Thomas W1TXT) using 1/2 watt output
from my balloon telemetry transmitter on my end to a dipole in my backyard in
Huntsville, Alabama....The signals received in CT ranged from +10 dB above to
-14 dB below the noise.

Over the period from midnight to 4 am over the past week I could reliably
receive the half-watt transmitter good enough to copy the telemetry on almost
every sequence on at least one of the modes I tested.

Here's the results of each mode that was tested and their pros and cons:

CW (15 WPM) - (40 percent good telemetry frames received over the test
period using a SSB filter at 3 khz - about 60 percent when using a 500 Hz CW
filter)

Tough copy at times....with a tight CW filter could bring it up with
better results...subject to static crashes and local interference....hard to
decode on a computer program when at or below the noise level....best results
using a "gray matter" decoder. Slow data rate.

RTTY (45 baud standard 170 Hz shift) - (25 percent reception over the test
period)

Needs to be 0 dB or better above the noise level for reliable copy from what
I could tell. Sensitive to static crashes and nearby interference and

affected greatly by fading. Since using a Baudot 5-bit character set, you are limited to upper case with few choices for punctuation...also when interference causes you to flip to LETTERS mode, all the numbers can get received as letters for that transmission...but it's easy to encode in a microcontroller and works great when you have good signal levels. (to decode: MMTTY, MixW, MultiPSK, DM780, Hamscope, DTRC to name a few)

Hellscreiber (Feld-Hell mode) (40 percent reception over the test period)

Since it's a visual FAX-like mode...your eyes perform filtering on the noisy data when it's below the noise level....can get reliable copy down to between -3 to -5 dB below the noise...so definitely an improvement to RTTY but becomes unreadable below -3 to -5 dB. Also affected by fading...but the good news is that even with a PSK31 transmission almost on top of it, I could still read the data.
(I use either IZ8BLY's Hell-Hell program, MultiPSK, MixW or DM780 for Hellscreiber decode)

DominoEX (5, 11 and 22 baud modes) (95 percent reception over the test period).

This is a multi-frequency shift keyed mode...18 tones....it's my mode of choice for reliable data transmission with low power transmissions. A vast improvement over RTTY and even Hellscreiber....it can achieve perfect copy down to -10 dB below the noise level. I couldn't tell any difference in the performance between the 5 and 11 baud modes and the 11 baud mode is just as fast as 45 baud RTTY. The 22 baud mode really is fast (twice as fast as 45 baud RTTY) but it goes away at about -7 to -8 dB...so you do take about a 3 dB hit for the 22 baud mode, but still far better than RTTY.
The other nice thing about this mode is that it's not very critical how close you are in placing your cursor on the decode program onto the center frequency....there is quite a bit of room to play with....also it handles a drifting signal quite well (200 Hz/min). Other MFSK digital modes will only work if you have tuned exactly to their frequency...so the DominoEX mode is quite an easy mode to tune in. It handles static crashes and I even had a continuous static burst from a neighbor's light dimmer pop up once right in the center of it and it didn't affect it at all....it even handles deep fades well as long as the fade doesn't go below -10 dB S/N. You can decode DominoEX even when you can't even hear the RTTY tones or CW. The only downside I can see to this mode is that only a few programs support it....I really hope this mode catches on more since it is an improvement over some of the more complicated modes I've seen out there...also this mode is one of the easier ones to produce on a microcontroller....it can do the entire ASCII character set (both upper and lower case as well as special characters) and has a special secondary set that displays a second message in a separate text window.
The programs that do support the DominoEX modes (not to be confused with the earlier version called DominoF) are in order of my preference:

--- MultiPSK (does just about every digital mode conceivable - I use this one for everything)

--- ZL2AFP's DominoEX (dedicated to just DominoEX)

--- DM780 (part of the Ham Radio Deluxe software) - only does 4,8 and 16 baud
....all of these are free downloads.

Here's a great description of the DominoEX mode and it's advantages and a
speed comparison with other modes such as RTTY:

http://www.qsl.net/zl1bpu/DOMINO/Index.htm
(http://www.qsl.net/zl1bpu/DOMINO/Index.htm)

Here's my observations of the time taken to send that balloon telemetry
frame I showed at the top of this email with various digital modes:

RTTY(45 baud) = 13 seconds
Hellscreiber = 21 sec
PSK31 = 22 sec
DominoEX5 = 26 sec
DominoEX11 = 13 sec <-- same speed as RTTY
DominoEX22 = 7 sec <-- 2X RTTY speed

CW (15 WPM) = 90 sec

For a faster data rate, 300 baud packet could be used, but would require a
good margin over the noise level to decode. I'm just about done with
programming this mode into my microcontroller so I may try a flight test or two of this
mode as well.

down to -10 dB below the noise level. I couldn't tell any difference in the performance between the 5 and 11 baud modes and the 11 baud mode is just as fast as 45 baud RTTY. The 22 baud mode really is fast (twice as fast as 45 baud RTTY) but it goes away at about -7 to -8 dB...so you do take about a 3 dB hit for the 22 baud mode, but still far better than RTTY.

The other nice thing about this mode is that it's not very critical how close you are in placing your cursor on the decode program onto the center frequency....there is quite a bit of room to play with....also it handles a drifting signal quite well (200 Hz/min). Other MFSK digital modes will only work if you have tuned exactly to their frequency...so the DominoEX mode is quite an easy mode to tune in. It handles static crashes and I even had a continuous static burst from a neighbor's light dimmer pop up once right in the center of it and it didn't affect it at all....it even handles deep fades well as long as the fade doesn't go below -10 dB S/N. You can decode DominoEX even when you can't even hear the RTTY tones or CW. The only downside I can see to this mode is that only a few programs support it....I really hope this mode catches on more since it is an improvement over some of the more complicated modes I've seen out there...also this mode is one of the easier ones to produce on a microcontroller....it can do the entire ASCII character set (both upper and lower case as well as special characters) and has a special secondary set that displays a second message in a separate text window.

The programs that do support the DominoEX modes (not to be confused with the earlier version called DominoF) are in order of my preference:

--- MultiPSK (does just about every digital mode conceivable - I use this one for everything)

--- ZL2AFP's DominoEX (dedicated to just DominoEX)

--- DM780 (part of the Ham Radio Deluxe software) - only does 4,8 and 16 baud

....all of these are free downloads.

Here's a great description of the DominoEX mode and it's advantages and a speed comparison with other modes such as RTTY:

http://www.qsl. <http://www.qsl.net/zl1bpu/DOMINO/Index.htm> net/zl1bpu/DOMINO/Index.htm

Here's my observations of the time taken to send that balloon telemetry frame I showed at the top of this email with various digital modes:

RTTY(45 baud) = 13 seconds

Hellscreiber = 21 sec

PSK31 = 22 sec

DominoEX5 = 26 sec

DominoEX11 = 13 sec <-- same speed as RTTY

DominoEX22 = 7 sec <-- 2X RTTY speed

CW (15 WPM) = 90 sec

For a faster data rate, 300 baud packet could be used, but would require a good margin over the noise level to decode. I'm just about done with programming this mode into my microcontroller so I may try a flight test or two of this mode as well.

Hello to all,

We are an university of Uruguay without many economic resources, but we have a great potential human
and big desires that to build a cubesat with our students of the career of electric engineering.

We are following the steps toward the learning on this topic but we need some help.

Until here we have arrived in a year of work:

http://iie.fing.edu.uy/twiki/bin/view.cgi/Satelite/GloboSat01Informe

http://iie.fing.edu.uy/twiki/bin/view.cgi/Satelite/GloboSat02Informe

http://iie.fing.edu.uy/twiki/bin/view.cgi/Satelite/GloboSat03Instructivo

http://iie.fing.edu.uy/twiki/bin/view.cgi/Satelite/GloboSatsMain

We have tried to achieve the help of some people had involved for many years in projects with
satellites but them they don't have the time to look toward an university with low resources that
she cannot pay for their services.

Do you know some person that has the time and the enough generosity to help us in our project?

Thanks to all in advance for the help that you can give.

I have permission to host GPSL 2009 at my work and the school is very excited. However, no one will be here during a vacation weekend. So I need to see about moving GPSL a week earlier or later. August is not do-able because school will be starting up again. We could move GPSL to late June, as there would be enough time. But the school seems more interested in July.

Hi Paul,

We're with the school; as we indicated in our 26 Jan email, EOSS would like GPSL to be the weekend of 18 or 25 July.

BTW thanks for taking on the sponsorship of GPSL FOR 2009.

5005. GPSL 2009

Yahoo group: GPSL (2009 — 2010)
Date: 2009-02-07 03:41:42 UTC
From: L. Paul Verhage
Topic: 4595 Message: 5005

I've got some volunteers from the local radio club.

Here's my plan, let me know if I'm missing something.

I'll schedule the conference at KATS. It has an LCD projector and two screens. KATS has a cafeteria, so I'll try to arrange lunch there.

I've contacted Garmin to see if we can schedule a tour. That would be on Thursday afternoon

I'll get local hotel information. Perhaps we canget a conference discount. There's a nice looking hotel 1/2 mile down the road from KATS.

The local hams will help me with repeater information.

I'll contact the magazines in April for welcome packets.

I'll contact Parallax and Byonics for door prizes. Does anyone have additional door prizes they can get donated.

The radio club volunteers will help at the door.

I'll make dinner reservations a week before GPSL.

I need a t-shirt design for Zaggle or similar site. Does anyone want to come up with a design?

I need to find launch sites. I'll look at local schools. KC, are you familar with possible launch sites between Topeka and KC. I'll recommend we launch at KU if the weather will cooperate. There's a huge soccer field we could use.

I'm trying to talk the Topeka club into mission control at KATS. The KU club has expressed an interest in doing this (this is more incentive to launch from Lawrence).

One my local volunteers knows the media fairly well and I think KATS will help out there (so please be on your good behavior).

Does the CAP want to design BalloonSats? We could arrange a ride for them.

I'll invite the 4H SpaceTech to visit.

Am I missing anything?

Thanks

Normally NSTAR supports a UNO BalloonSat flight in mid-July, probably the 18th this year. I think we can probably move the flight to the 11th and the 25th would be OK for GPSL. I'd rather not do flights on consecutive weekends but if it has to be that way we'll try to make it work.

Hi Paul

My wife passed away on the 21 of December, and I have been out of th
loop for awhile. Just starting to get the ore's back in the water so
to speak, and I am really looking forward to attending this year GPSL.

I will provide an OpenTracker 2+ or a couple of OpenTracker 1+'s for
GPSL 2009 door prizes. I will also be contacting Microwave Data
Systems in hopes of getting a couple of 1 watt spread spectrum radios
for door prizes too. I have a few in roads and contacts there so I
hope to swing some kind of sponsership.

Also have 8 or so older 8 channel but small Trimble GPS units that I
will throw in too (still waiting altitude flight testing on these
units). These would be usefull for those non-recovered long flights
when cheap IE expendable is needed.

I might suggest the following vendors as possible door prize donors
as I have used them often for my balloon experiments as I'm sure
others here have too...

All Electronics
Argent Data
Byonics
Doppler DF (microhunt)
Electronic Goldmine
Garmin
Kaymont Balloons
K1EL Keyers
Rocket Man Parachutes
Spark-Fun Electronics

Sounds like you have some great plans in the works for GPSL 09.
Thanks for your efforts.

Regards,

Ron Cathcart

5010. Vacuum Chamber

Yahoo group: GPSL (2009 — 2010)
Date: 2009-02-10 17:00:36 UTC
From: L. Paul Verhage
Topic: 5010 Message: 5010

Okay, the pump has been connected tot he vacuum chamber. It didn't implode and has held a vacuum for 5 minutes. I need to get a pressure gauge next.

The plan is to place the dry ice in close proximity to thye plastic tank, but not in contact. That's to ensure the plastic isn't embrittled by the cold temperatures of the dry ice. I've ordetred 20 UV LEDs of 395 nm. With With 510 ohm resistors and 9V, the system should draw 1/3A. The LEDs will close to the sample under test, so the UV should be reasonably intense.

Paul

5011. Vacuum Chamber

Yahoo group: GPSL (2009 — 2010)
Date: 2009-02-10 19:05:37 UTC
From: L. Paul Verhage
Topic: 5010 Message: 5011

We've now made a cap full of water boil. I can see the tank is not air tight, the water stops boiling when the pump shuts down. But after ten minutes of waiting, there's still a healthy rush of air flowing back into the tank. I'll look for a pressure gauge after class tonight.

Hi Paul,

It's tough to resolve meaningful pressure altitude above about 80K' with an
8-bit ADC, isn't it? At 100K', the absolute pressure is only 1% of MSL,
and you're quantizing error alone is 0.4% (1/256) of full scale. It's OK
as a backup in the event of loss of GPS GGA data, however.

Any pix of your chamber available on the web?

I would agree with Mike on that point about the 8-bit ADC resolution....even a 10-bit ADC (which is what I have on my PSoC flight computer) is pretty rough above 80,000 feet. Also, note that some pressure transducers don't work down to a complete vacuum...they are often set for some fairly high pressure cutoff where they flat-top. The very nice but useless MPX5100AP is an example of that. The first batch of these worked great up to 100k feet....the second batch stopped at 44,000 feet....when I asked the factory rep what was going on, he said it was too costly to calibrate them down to a vacuum so they stopped at 44k feet. They didn't even mention this on the datasheet until years later.

My current favorite pressure sensor that is a stock item is the Honeywell ASDX015A24R (available from Digikey) ... it's temperature compensated, 0.5 - 4.5 volt output and it still gives an output at 100k feet, but it's plus/minus a couple thousand feet with a 10-bit ADC at that altitude....(much worse with an 8-bit ADC)....also you have to consider that the temperature compensation will affect the output of the sensor bridge...some are compensated for temperature and some aren't....even the compensated ones have a different response characteristic below a certain temperature....0 deg C for many. But then, that's the nice thing about having a temperature controlled vacuum chamber...you can see that effect in the output (as long as your ADC has enough resolution). I have a calibration chart showing the ASDX015A24R 10-bit data compared with GPS altitude during a flight a few months ago...I'll try to email it soon.

From: wb8elk@aol.com
Topic: 5010 Message: 5015

Another thing to consider.....I've done some experiment comparing the Vaisala Radiosonde (RS80) pressure altitude data compared to a GPS altitude reading on several hitchhiker ozonesonde flights.....the aneroid barometer sensor that Vaisala makes (it works as a variable capacitor in an audio tone generator circuit) is surprisingly accurate even above 100,000 feet....just as their specs claim. Now if you can extract the calibrate curve formula from Vaisala (good luck), then you'd have a nice cheap altitude sensor since the surplus sondes are quite cheap on eBay....and once again, that's the nice thing about having your own vacuum chamber with temperature control....you can calibrate these things to be useful in payloads. By the way, the audio frequency output tone from the pressure sensor does have a temperature drift which is measured and calibrated out by the Vaisala ground station software. I've built an XR2211 decoder (along with Visual Basic program) to pull out the actual audio frequencies sent down by the Vaisala (each sensor channel varies from 7500 hz to 9300 hz)...but I haven't as yet calibrated the sensor to make sense of the tone frequency values. Vaisala supplies a calibration coefficient chart with each sonde, but you have to know the curve fit formula to make the chart worthwhile.

If you have a really old sonde....the old VIZ ones....they have a contact switch that moves along over 150+ switch contacts as the altitude increases....they supply the direct conversion chart from switch contact to pressure.....I once did a circuit to count each transition and keep count of the actual switch number...however, that method fails during descent....these do however, make great pressure switches if you have a vacuum chamber to calibrate them with....just put a microswitch on a metal frame that holds the aneroid bellows...when it reaches the altitude you want to sense, just turn the bellows on it's screw until it pushes the switch at your pressure altitude when you vacuum test it. We used these on the rockoon flights as a safety lock so we didn't accidentally fire the rocket until it was above 60,000 feet...once above that altitude, the pressure switch closed and we were Armed and ready.

5016. Re: [GPSL] Vacuum Chamber

Yahoo group: GPSL (2009 — 2010)
Date: 2009-02-12 01:19:36 UTC
From: L. Paul Verhage
Topic: 5010 Message: 5016

I find 8 bit resolution sucks to an extent. I'm reporogrammng the BalloonSat flight computer for 10-bit resolution tonight and will run it through tomorrow. I'll have to see about shrinking a 12 bit ADC to BalloonSat size one of these days and put it inside the vacuum chamber.

I picked up a vacuum gauge from an auto parts store tonight. I want to hook it in tomorow and compare readings.

The pressure sensor for this data is a SM5812. I do have some MPX5100's to try some day, it might make for an interesting sidebar.

I'm bringing my camera tomorrow and will get some pix.

I'd be interested in trying the Vaisala barometer sensor. I think you could charge it up through a fixed resistor with a BASIC Stamp and count how long it takes for the voltage across the cap to get to 1.4 volts (the high-low transistion for a Stamp). I also think you could dispense with the calibration curve and dump a table of time and altitude into one of the memory banks of the BS-2pe. The BS-2pe would then pull the altitude out of the table on the fly and record it.
The vacuum chamber is not a super accurate environmental chamber at this point. I'd like to make something that works well, but it doesn't have to be aerospace quality. The goal is that it should be easy and cheap to replicate and give anyone doing a BalloonSat workshop another gee-whiz test.

Overall I'm pleased with it. It hasn't busted yet. I'm cutting and gluing foam for the dry ice chamber. I'll pick up a cheap thermometer this weekend. The UV LEDs I bought are in the UV-A spectrum. I'd really like to get into the B or even C spectrum, but I need to find inexpensive ways to do it. I'm surprised how expensive battery powered UV lamps are.

Paul

From: L. Paul Verhage
Topic: 5017 Message: 5017

I just got confirmation that my PCB orders from BatchPCB have been sent to me. BatchPCB looks like a pretty good place to make small orders of PCBs, you migfht want to check it out.

One of my orders is for the mini BalloonSat flight computer I'm experimenting with (it's a minor modification of the one I sent to EOSS for testing). I'll post information on them on the NearSys website as soon as I get it in and tested. The near space article in the March Nuts and Volts will also discuss it.

Another option for low cost PCBs is PCB Fab Express.

http://pcbfabexpress.com/

I've had them make a number of 2 and 4 layer boards and they were all
good quality.

I use this sensor at 10-bit resolution and have been happy with it.
It's not real great in an absolute sense at high altitude as one or
two-bit changes make a big difference in the derived altitude, but
it's reasonably good at detecting the pressure increase after burst.
I calibrate it to a millibar reading and report that out. I use it in
a gross sense as an altimeter should the GPS fail. I have several
Excel files showing the pressure and GPS altitude at 2-3 sec intervals
for a number of flights (which I should put on my website someday).

Conversion from pressure to altitude depends a lot on the temperature
profile of the atmosphere below the sensor. If you're using a
standard atmosphere, you'll find significant deviations from a
GPS-derived altitude, especially as the temperature profile becomes
much warmer or cooler than standard. With a decent microcontroller
and the proper algorithms, you could do all those corrections on board
if you have a decently-calibrated temp sensor you're logging on the
way up. Radiosondes back this out with ground processing.

Hi Bill,

Hey, thanks for the tip on the new Honeywell xducer. Kinda neat how they embedded an ADC, DAC and a brain to do compensation. And it's priced better than the old Mot part that we used to know and love.

The only thing that bugs me is this, quoted from the top of the spec sheet:

All ASDX Series sensors are accurate to within ±2.0% full scale ...

That's over +/- 20 mbar, so it could even 2-block at the top before it hit 100K'. But nonetheless, it's a great backup for loss of GGA.

Here's a link to the data sheet:

http://sensing.honeywell.com/index.cfm/ci_id/140501/la_id/1/document/1/re_id/0

I wonder if Honeywell might be thinking of coding that uP with a lookup table to yield a linear voltage vs pressure altitude? That would be entirely 2-Kewl!

From: Mike Manes
Topic: 5010 Message: 5021

A couple of years ago, I loaned one of the new guys from Nebraska a Viz anaeroid-based pressure switch as Bill describes to fire his cutdown; it was calibrated in the EOSS chamber to operate at 80K' - and the peak altitude reported by his APRS was like 79.3K'. Missed it by 700 ft :={.

I also use the anaeroid cell from older surplus Viz 'sondes to arm the fast release. It's got something in the range of 0.16 to 0.21" axial expansion between 5K' here in CO to 100K' - but it tops out there. It will generate several lbf when constrained, tho, so be sure to use a microswitch with enough overtravel to keep it from getting crushed, especially if it's set to trip below 50K' for a trip to 100K'; not a consideration if it fires a cutdown, tho.

I've also played with the Vaisala xducer a long time ago, pre-chamber, so don't have a cal curve. But the temp compensation could be a dicey issue. The Honeywell ASDX device is a much nicer solution, IMHO, despite its iffy FS error spec.

Hmmm ... I think a PCB is great if you need multiple copies of a given design. But in my experience, balloon payload circuitry is built as onesies. So I use perfboard, and from time to time, raw clad G10 and a Dremel tool to get up and running fast (and cheap). I've even used SMT ICs this way - glued down dead-bug form - with bare #30 AWG between pins and the board. Oogly but effective.

Has anyone tried building a crude vertical speed indicator (VSI - my
suffix :-) using a sensitive differential pressure xducer with one
port hooked to a "leaky" volume, like a ping-pong ball with pinhole?
Could be used as as simple, fast burst detector.

Yeah, but when you find out just how inexpensive batchpcb is, you'll never make a wire wrap board again!!! (at least for the tiny boards I make). They're about as cheap as you can get -- only drawback is the time it takes......

They route their orders thru www.goldphoenix.biz, I use them for all of my volume board runs. Great service, and great prices

Hi Greg,

Well, I can design and build a perfboard circuit in less time than it takes to lay out a PCB using my favorite CAD program (TangoPCB), and it's up and running the same day. I don't use wire-wrap any more - too bulky. I do use #30 AWG Kynar, but solder point-to-point to IC sockets and discrete component leads. With careful layout, the excess leads themselves are used to make the connections.

But if I ever find a need for several copies of the same circuit, then I'd sure consider laying out a PCB in lieu of fabbing several pefboards.

BTW, back when I was prototyping all-digital (read TTL and CMOS) circuits, I grew to love the 3M prototyping method, which replaces wire wrap pins with IDC pins on IC and SIP sockets. Each pin could accommodate 1 or 2 #30 kynar leads ... just lay the insulated wire over the pin and punch it down. Multiple-node wires daisy-chained lickety-split. I built a machine controller using that system, and it survived some pretty nasty vibration no sweat. Only issue was the cost - about same as wire-wrap - but the circuit side depth was about the same a thru-hole PCB (0.12 max above surface). Works with any 0.1" grid perfboard, plated or not.

Mike,

Yes, that's one thing I can't say -- no way I could get mine up and
running in one day!

And, right again, I probably spend more time laying out the board than
it would take to get it thru the PCB program -- especially if you have
to start messing around w/ creating new library components....

From: Mike Manes
Topic: 5010 Message: 5027

I use some 3/4" wide foam rubber weather strip for my lid seal. It crushes down when vacuum first develops and gets tighter as vacuum increases. No need to seal the end joints - just butt 'em together, and the vacuum will pull 'em in. Once I've pulled down to 10 Torr and shut the pump off, there's still 15 Torr in there after 5 minutes. Sometimes I have to push on the lid a bit to get a vacuum started, but just momentarily.

5028. [GPSL] PCB layout and schematic capture programs?

Yahoo group: GPSL (2009 — 2010)
Date: 2009-02-12 08:31:40 UTC
From: wb8elk@aol.com
Topic: 5028 Message: 5028

In a message dated 2/11/2009 10:23:32 P.M. Central Standard Time,
mrmanes@... writes:

Hmmm ... I think a PCB is great if you need multiple copies of a given
design. But in my experience, balloon payload circuitry is built as
onesies. So I use perfboard

Hi Mike....I used to do that for onesies....but some of these board houses are so inexpensive and with very quick response, that it actually saves me a lot of time and bother now to make a PCB up and have it in a couple of days instead of the hours and hours it takes to breadboard it up on perf board...even for onesies. When I do a perf board design...my favorite proto boards are the ones from Radio Shack that have the power traces on them. There is also a very nice perf board in the same pattern as those solderless breadboards available from Mouser that has power traces on either side of the center holes...I really like that one since you can transfer a solderless breadboard design directly to this perf board in no time flat since it's the same hole pattern....it's made by _www.busboard.net_ (http://www.busboard.net) and it's their part# BR1 (available from Mouser). It's even better than a solderless breadboard since it has 3 power rails on either side of the holes.

PCB Layout software:

I'm currently using Advanced Circuit's "bare bones" service...they make nice quality boards and are quick and reasonable....also I have used Express PCB (with their free software) and AP Circuits.

For board layout, I use Ivex Winboard (long discontinued however). I also use Eagle and the Express PCB free software. However, the Express PCB stuff can only be used for ordering from Express PCB...no access to Gerber files....I've found that Eagle is very "counter-intuitive" - (and I'm being kind when I say that) when it is compared to other layout tools. I have a real love-hate relationship with Eagle...but it's saving grace is that there are an amazing amount of component footprints that are in the public domain. Be prepared to have their manual handy and a friend who knows Eagle nearby when delving into the Eagle world....I do love Ivex Winboard since I can layout a PCB as quickly as I can think and build footprints just as quickly...but sadly they just went belly-up 5 years ago and haven't been seen since....ExpressPCB's software is very similar to the Ivex Winboard interface so perhaps that's what happened to it.

I'm curious as to the programs that others have been using and their
comments (pros and cons).

Schematic Capture:

As to schematic capture...I'm a real fan of DesignWorks by Capilano since it can work with quite a variety of PCB layout programs...once again I can draw a schematic as fast as I can think with Designworks...It was originally written for the Mac but performs equally as well for the PC....if you want the convenience of an integrated environment however, Eagle does shine there since if you change something in the schematic, it makes the change on the PCB layout as well....my same comments as to "counter-intuitive" interface apply also to the Eagle schematic capture. I'm also not a particular fan of the schematic capture capabilities of ExpressPCB software but I do like their PCB layout tool for small board designs.

I've used a SenSym (now Honeywell) ASCX15AN. It is also available from Digikey. It is the slightly more accurate version of the ASDX015A24R Bill is using (at 3X the cost - $70). It offers 0.2% accuracy at FSO (Full Scale Output). I used a 24-bit ADC. Way over kill. Also on this board is one of the first generation MEMS accelerometers.

http://kd7lmo.net/nsrv_analog.html

Some charts from the flight test.

http://kd7lmo.net/ansr/ansr_14_charts.html

Now I just used a set of SiRF Star III based GPS engines. I might drop out for 2 or 3 seconds right after burst, but it is generally 100% coverage.

I have had good experiences with BatchPCB as well. I flew PC boards
with a Lassen iQ GPS, sensors, and an A/D board. It all worked great!

Don't forget that, as the cap of water is boiling, it's releasing
water vapour into the enclosure, which will be pushing the pressure
up.

One of the problems with building a 12 bit (or higher) DAC is that the resistors in a R-2R type of ladder need to be exceptionally high precision. Additionally, you have to worry about temperature variations (especially if the temperature coefficient of the resistors vary!). It's obviously possible, but not necessarily easy.

One approach you might want to consider is a Voltage to Frequency converter.

Another approach is one I cam up with about 30 years ago involving a comparator, an RC timing network, and a counter. The disadvantage is that it's not an instantaneous conversion, but that's not really needed for altitude sensing. Another problem is that the temperature coefficient of the RC network has to be known/calibrated. And, it produces a non-linear output (although this can be replaced by using a constant current source in place of the resistor).

Anyway, those are just a couple of things to consider.

That's the same basic approach I outlined above, only using a
comparator for the sensing, and the counter for the timing.

Consider using a constant current source to linearize the charging
of the capacitor.

I'm not sure if you'll be able to find LEDs that go much farther
up in the UV spectrum (or, at least, not cheaply).

> I'd really like to
> get into the B or even C spectrum, but I need to find inexpensive
ways to do
> it. I'm surprised how expensive battery powered UV lamps are.

The typical way of producing reasonably large quantities of UV
are with a Mercury vapour discharge. It's difficult to run these
from a battery/DC source. I suppose one option might be to use a
germicidal light and power it from an inverter (watch the heat
dissipation!). Another might be to use the light from a UV EPROM
eraser (I may even have a DC/wall-wart powered one stashed away
somewhere!).

Just don't look at the UV-B or UV-C stuff.

Anyway, it sometimes helps to think outside the box. :-)

For my onesies I make a PCB at home with DALPro parts and Ares Lite to design the PCB. I can shoot, develop, etch, and drill the PCB at home. The baords are high qaulity and I've never come across something I need that I couldn't make.

I'm starting to use BatchPCB to test commerical designs. The goal is to go to Gold Phoenix myself to make larger lots of tested boards.

I figure with Ares Lite and DALPro, I can come up with an idea on Friday after work and have it working before going back to work on Monday. Of course, this depends on the complexity and my free time.

5035. Re: [GPSL] Re: Vacuum Chamber

Yahoo group: GPSL (2009 — 2010)
Date: 2009-02-12 17:27:37 UTC
From: L. Paul Verhage
Topic: 5010 Message: 5035

I have some pix, I'll copy those tonight to my drive and email them out. I did hook up a vacuum/pressure gauge from Carquest and it says 29.5" Hg. So as far as cheap pressure sensors say, the vacuum chamber is getting to zero mb. I suppose that will be good enough for a toy environmental test chamber.

The UV source is going to be my next problem. I know I can at least test to the visible-UV border.

Right now I'm trying to calibrate a MPX5100 connected to a TLC272 op-amp. I want to use it for a weather station. Just sitting in the room at 10-bits precision it shows a lot of variation. I'm going to try to block air flow across the sensor to make sure it's not a breeze I'm seeing.

5037. NASA balloon broke endurance record for Antarctic flights.

Yahoo group: GPSL (2009 — 2010)
Date: 2009-02-12 20:01:46 UTC
From: Luis Eduardo Pacheco
Topic: 5037 Message: 5037

New endurance record for an Antarctic flight - 02/09/2009 *Williams Field, Antarctica.-* Surely, NASA's balloon program will not forget the 2008/2009 balloon launch campaign, not only by the smooth development of the first two flights (ANITA and CREAM, both of them finished and recovered) but by the most succesfull flight ever of the program's "jewel of the crown" the ULDB (Ultra Long Duration Balloon) flight test.

Added to the quiet and troubleless flight of the 7 million cubic feet giant pumpkin, which finally was extended to perform a third circle to the continent, *at 19:07 UTC on February 7, after being 42 days and 17 hours aloft it broke the previous duration record of 41 days, 21 hours and 16 minutes set by the CREAM LDB mission there in 2005*.

More on this at http://stratocat.com.ar/indexe.html

5038. Re: [GPSL] PCB layout and schematic capture programs?

Yahoo group: GPSL (2009 — 2010)
Date: 2009-02-13 03:48:36 UTC
From: Mike Manes
Topic: 5028 Message: 5038

Hi Bill,

Sometimes I'll do a perfboard where I have confidence in most of the design, but use it to breadboard the kinky bits - and from time to time, I have to tweak some changes in. That's tougher to do with a PCB - gotta cut traces, etc.

I also like the Rat Shack perfboards since the pads are well adhered so if one needs to pull a component, the pad stays in place. For noise-susceptible stuff, I prefer the 2-sided boards with plated-thru holes that have a ground plane on one side, but the ones from Vector make my wallet hurt!

Thanks for the lead to busboard. Nice line of products!

Topic: 5010 Message: 5039

Resistor ratios rather than absolute resistance is a key requirement for ADCs and DACs, and it's easy to control diffused poly resistor ratios quite precisely via geometry. And 12-bit monolithic ADCs are available off the shelf as cheap as $3.00:

http://mouser.com/Search/Refine.aspx?Keyword=ADC+12-bit

I use a germicidal UV lamp and ballast intended for use in a domestic clothes dryer (to lend the scent of clothesline-dryed duds) for my EEPROM eraser. It runs from 120VAC and cost <$5 from a local appliance parts store. Not sure of it's spectral content, however - suspect it's Hg vapor.

There's one good thing to say about the Radio Shack perf baords, if I can breadboard the design, I can transfer it directly over to the perf board.

When I just one design to make, I usually encourage my students to get their PCB designs ready so I can add my small board to their boards. We waste less PCB that way.

I need to include this inside the vacuum chamber. I don't know how much UV
will penetrate the plastic jar. I suppose I could put some day-glow inside
and see how much it glows.

Here are two photos I've taken of the chamber. Now I'm working on a cover
to hold dry ice. The foam pedestal is hollow and will also contrin dry ice.

Yet another COTS GPS beacon, this one using GSM cell links vice satellite for
its reports. Suppose it would be great if your payload lands where there's
GSM coverage.

Engineering TV found Simon Buckingham, CEO of Zoombak, at CES 2009 to
talk about their line of personal GPS locators. A-GPS technology helps
you precisely and reliably determine the location of the Zoombak Locator
unit. Continuous tracking, location tracking, device alerts -- all are
available on-demand via Zoombak.com, text message alerts, or accessing
customer care for live location support. Zoombak is great for monitoring
those with special needs, teen drivers, your family pets, and staying
connected to the things that matter most to you.

From: Jeff Dailey
Topic: 5046 Message: 5046

There is a launch Saturday 2-21-2009.

Flight Information
Flight: CCLI15
Flight Number: 144
Origination: Oral Roberts University
Flight Locaction: Tulsa OK.
Flight Time: 10:00AM
APRS: KB9ZNZ-11

5047. Interesting audio of "UFO" - Possible ARHAB?

Yahoo group: GPSL (2009 — 2010)
Date: 2009-02-20 18:05:41 UTC
From: gregwilliams@knology.net
Topic: 5047 Message: 5047

http://www.2shared.com/file/4920499/2d7fb2ad/f15chase.html

I'm working to try and get more info on this as to when and where this was recorded, but it sounds like 2, maybe 3 F-15 pilots encountering an object at about 17k feet.

The airspeeds they indicate (30-80 knots) and it looked to be climbing 17k, then 17,700, then 18k feet.

They indicate it "looked like a rock". I wonder if it could also be one of those "space balloons" that's been discussed for use as a super-pressure balloon.

Interesting to listen to. Consistent with that of a balloon of some sort judging by speed and altitude climb.

From: Mark Conner
Topic: 5048 Message: 5048

Anyone make some orders recently from Kaymont? I'm looking to buy a few 1200 or 1500g balloons shortly and wondering what to expect on prices.

Paul and I spoke recently, and he did say the price for 3000's was going up by $10 due to exchange rate pains. So I'd expect Totek 1200's from Kaymont to go up at the most by $5.

Paul's good at responding to emails: paul@...

Jonathan Trappe has an Amateur Radio license, KJ4GQV, as of 16Sep08. This may have been his first
APRS-equipped ClusterBalloon flight. Peak APRS reported altitude was 53kft. I sent him a message
and will share any significant response.

Hi,

I was experimenting with some APRS software today when I looked at the
list of mobile stations in my area and noticed a balloon taking off a
little after 2000 UTC today in Statesville, NC. The callsign was
KJ4GQV, and his packets were advertising his web site,
www.ClusterBalloon.com. The balloon apparently made it to over 53000 ft.

He seems like quite a character. Might want to keep an eye on him.

If he actually hit 53K', then the FAA will be giving him a visit, since he busted Class A airspace. Maybe at his funeral, if he weren't wearing a pressure suit, or as a minimum, breathing 100% oxygen. Then again, he may have been granted a waiver, but he'd still need the suit and/or O2. Could be the beacon was on one of the balloons that he cut away.

Hi Mike...I found this mention of his plans to go above 18,000 feet on his website...apparently he does have an FAA waiver to do so (and the required equipment)....but 53,000 feet seems a bit much...I would make more sense to think that the APRS tracker went up on a balloon he cut free...or was a test flight of his to see how high one the balloons he uses could go before bursting...but who knows...it would be interesting to see more news on this.

- Bill WB8ELK

From"ClusterBalloon.com"

==========
Trappe's first cluster balloon flight soared to 14,783 feet-- in a standard, unmodified Steelcase Uno office chair. His next flight, under the 'Blueberry Cluster,' ascended right to the threshold of the highest altitude allowed by the FAA: 17,930 feet (just shy of the Class A controlled airspace at 18,000 feet!)
Now, with a waiver from the FAA and the required equipment (aircraft transponder, oxygen system, aircraft radios, plus permission from local and regional air-traffic controllers) Trappe is planning a flight into very thin air: above 20,000 feet! This is the altitude regional jets fly! At these altitudes, the air is thin, and cold. An adventure indeed.

Hi Bill,

He'd need quite a few more balloons to get to 50K - like 10x as many, assuming that the ones he flies now are filled just shy of burst. And that pressure suit will boost his neck load quite a bit!

OK on his getting waiver and transponder. I guess he managed to persuade the FAA that he didn't need an airworthiness cert for his balloons and lawn chair :=}.

Seems his 53K' flight was just another ARHAB unmanned flight - glad to see that he's discovered what REAL ballooning's about, eh? :=P

Morning all,

In the spirit of "Open Source Amateur Ballooning" I offer the
community a web based version of what we here at Near Space Sciences
have been using for all twenty years of doing these flights. before the
coming of the home computer we did it all on paper! now it's soo simple
it can be done in a web browser!

Only catch you must have java activated. or it won't work for you.

But we have been using this for longer than I can remember now, and
it's always been spot on, if it predicts the balloon should pop at
108,000 feet it pops someplace between 107 and 109 every time!

Enjoy all.
Feel free to publicize it to any list interested.
Joe

5058. Re: Fw: KJ4GQV Balloon on 21 Feb 2009

Yahoo group: GPSL (2009 — 2010)
Date: 2009-02-24 22:52:57 UTC
From: K. Mark Caviezel
Topic: 5050 Message: 5058

I've served as co-conspirator, launch crew, and technical advisor to Jonathan Trappe's manned and recent unmanned flight. He has flown on 34 to 38 'chloroprene' balloons, each filled with one K-bottle's worth of helium, resulting in about 12 pounds net lift per cell. The chloroprene balloons are about 630 grams each and it appears from the recent single cell flight that their burst diameter is apreciably smaller than a 600 gram latex balloon. Jon reported that the fill and launch was smoothly conducted, squleching the theory of the possibility of damage to the cell from pre-flight handling resulting in a lower than predicted burst altitude. The recent flight was conducted specifically to test the service ceiling of these chloroprene balloons.

BTW, his aircraft qualifies as Part 103 ultralight so no registration, and no N-number is needed, and he can fly in a completely legal manner (daytime VFR free of clouds) in Class E and G airspace with no comm, transponder, or FAA oversight or co-ordination. But he normally flies with an aviation radio, a transponder, and APRS and SPOT trackers. I believe he is trying to get an N-number for his aircraft (paraglider harness) to enable the possibility of cluster balloon flights in Europe.

One topic of interest is cell-to-cell damage, if any, of flying multiple cells together. I recall from the numerous Pioneer Astronautics/EOSS 'grapes' missions used to simulate Mars atmospheric entry that we would lose a cells one cell at a time, and never had an instance of one cell taking out another when it popped. I'd have to look it up, but these were missions in the range of EOSS 44 through the infamous EOSS 50.

Constructive, authoritative knowledge about cell-to-cell damage for clusters of extensible balloons is invited. Mr. Trappe is CC'ed.

best regards,

- Mark ng0x, pilot N123WX 'the white balloon'

5059. Streaming video of the upcoming UAH Balloonsat launch

Yahoo group: GPSL (2009 — 2010)
Date: 2009-02-25 08:39:42 UTC
From: wb8elk@aol.com
Topic: 5059 Message: 5059

During this Saturday's UAH balloon launch from Huntsville AL (8:00 am CST) I plan to do a test of streaming video of the launch via my laptop and a Verizon wireless card using the British Amateur Television Club's streaming video website. You have to be a paid member of the BATC to stream video, but anyone can watch their video streams. In fact, their streaming video service can handle quite a number of simultaneous viewers and it includes a very nice chat room.....to have the chatroom display your callsign use the command "/nick <your callsign>"....i.e. for myself it would be: /nick WB8ELK

The URL for this weekend's live launch coverage (starting a bit after 7:00 am):

http://www.batc.tv (http://www.batc.tv)

select "Members Streams" on the left of the page

Scroll through the streams window until you see: WB8ELK ... click on my callsign
and then click on VIEW STREAM.

- Bill WB8ELK

If this doesn't work for some reason, it will say "not streaming" next to my callsign....if it's working, it'll say "streaming"

5060. GPS Simulator

Yahoo group: GPSL (2009 — 2010)
Date: 2009-02-25 14:20:15 UTC
From: L. Paul Verhage
Topic: 5060 Message: 5060
Attachments: 3 described; binary payloads are missing from this source WARC

I was looking for information on reading GPS sentences with a PICAXE-18 (it's a bit harder than a BS-2 is) when I came across someone's comment on making a GPS simulator. I liked the idea, so here's what I've come up with. The attached files are the image of the completed board, the BASIC code it's programmed with, and a sample output. The board has a jumper that allows you to change configurations of the output. I'm not using this feature now since it's running low on memory. I'm collecting a full three hours of data today so I can plot the flight and check it for accuracy. I'll post that chart probably tomorrow.

It uses a PICAXE-08M, so it only has 256 bytes of memory. Outputting the GGA sentence takes all but 18 bytes of the available memory. I was looking for a formatting command like that in teh BS-2 to save memory, but can't find one. If you know, or come across the code to force the PICAXE-08M to output decimal data in two character fields, let me know (in other words, I want 1 to be formatted as 01). By using a format command, the code would take less space and I could probably as the RMC sentence to the code.

If it turns out formatting isn't possible, I'll use a larger PICAXE next time to create RMC and GGA sentences. But right now, the GPS Simulator should do a fair job of simulating the GPS output from a near spaceflight. The goal is that now you can run a flight computer on the ground and see how your program will respond without leaving the ground. You could even program a GPS fault and see how your flight computer will respond.

I'll be shooting some PCBs in the near future and will have room for a few of these simulator boards. If you'd like one to experiment with, let me know. By teh way, if you can figure a better way to code this, so it more accurately matches a real flight, let me know (this is just my first stab at the code and trying to shoehorn it into 256 bytes).

If it's of any use to anyone, there's an NMEA simulator up on the UKHAS wiki, which several people have found useful for some soak-testing of cutdown algorithms and the like (in the UK we like our cut-down algorithms and embedded landing spot prediction, because there there's a lot wet stuff all around us).

5063. GPS Sim Code

Yahoo group: GPSL (2009 — 2010)
Date: 2009-02-25 19:33:47 UTC
From: L. Paul Verhage
Topic: 5063 Message: 5063
Attachments: 1 described; binary payloads are missing from this source WARC

I fixed a bug int he code and gave it better resolution. It also now takes into account the knee in the ascent rate.

I see the terminal program in the PICAXE Editor doesn't have a large enough buffer for 3 hours of flight. So I'll try connecting the simulator to a flight computer and collect data that way. I want to see the descent profile looks reasonably correct.

Thought this trip in the wayback machine might be worth a visit. My first ham rig was a Heath DX-40 and AR-3 (with a command set "Q-5er" on the IF).

http://electronicdesign.com/Articles/Index.cfm?ArticleID=20689&pg=1

Some nice links to current kit suppliers is included.

From: L. Paul Verhage
Topic: 5060 Message: 5066
Attachments: 1 described; binary payloads are missing from this source WARC

I ran a test last night on the simulator and found some coding errors. Attached is an image of it being used. It's back at school now undergoing a new test. so far the flight computer thinks its at 33,000 feet and climbing. It's cool to see the flight computer run a mission while sitting on my bench.

I've finalized the design for the GPS Simulator and have attached a spredsheet from a simulated flight. I'm finally happy wit the code (which is also attached). While not perfect, I think it's good enough to to test a flight computer's programming for a mission.

For the vacuum chamber, I've replaced the plastic jar with a metal one. That way I can pack dry ice around it without worrying about making the plastic brittle. I tried a larger metal jar for the chamber (large enough to park a CubeSat inside) but found the plastic lid was too thin for the vacuum we were pulling. The UV bank is done and tested, it turns on when a super magnet is applied to the tank. I'll toss a piece of Fiesta Ware inside the chmaber to increase the radiation background. It won't be as much as at 62,000 feet (or the same amount of energy), but I think it will be a reasonable compromise.

5069. Lift Question

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-02 18:08:05 UTC
From: Pete Lilja
Topic: 5069 Message: 5069

I'm a little hesistant to ask as it is probably so simple...however, when looking at the spec page for Kaymont Sounding Balloons I am not sure I am understanding all I need to know when determining the size balloon needed for a flight.

http://www.kaymont.com/pages/sounding-balloons.cfm

Suppose I have X lbs. of weight in and including my payload box, parachute and suspension lines and I want X lbs. of lift beyond my payload which rows should I consider in the above referenced chart?

An additional question is extra lift: In my notes from Verhage's book I have written to have 4 to 5 lbs. of lift beyond the payload (non balloon) weight. Is that a reasonable assumption to insure a balloon rise to burst altitude?

Thanks,

Pete

5070. Re: [GPSL] Lift Question

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-02 18:52:47 UTC
From: L. Paul Verhage
Topic: 5069 Message: 5070

I recommend using the LiftWin program rather than looking at sounding charts (the chart, I believe, assume a specific payload weight that probably won't match your weights). Once you get the total weight you want to lift, you need to fill the balloon with that much helium plus an additional few pounds.

You need to first fill the balloon to lift the entire weight of your modules and recovery parachute (at that point the near space vehicle is neutrally bouyant). Then any extra helium gives your near space vehicle positive lift. The greater the positive lift the faster it will climb. LiftWin is a great program to run the numbers through to see what's going to happen. It's also flexible so you can alter your payload weights. If I remember, LiftWin is on the EOSS and the Near Space Ventures websites.

I've seen balloons go neutrally bouyant with just a little positive lift, so I recommend several pounds of positive lift. The greater the ascent rate, the faster the balloon will get to burst altitude. However, it also lowers the max altitude slightly. But the decrease in max altitude is tiny compared to how much faster you'll get to burst altitude. That's because to lower your max altitude by 18,000 feet requires twice the volume of helium in the balloon.

So adding that extra one pound of lift when there's already 9 pounds of lift for the payload and 2-1/2 pounds for the balloon inside doesn't alter the initial volume inside the balloon significantly. But that extra pound might get you to burst in 2/3rds the time, which means a shorter chase.

From: Pete Lilja
Topic: 5069 Message: 5071

Thank you, Paul. That is a clear explanation.

However, my initial question relates more to which size balloon I should purchase - i.e. a 1200, 1500, 2000 or 3000 so I know I'll have the capability of a proper fill / lift depending on the final payload design and weight. That is where I am confused by the Kaymont chart. I'd rather purchase no larger (more expensive) balloon than needed.

I'm sorry I wasn't more clear with my question.

Pete

If you're flying less than 12 lbs., you can't go wrong with a 1200g balloon - this will get you into the 80-95 kft range (closer to 80 at 12 lbs, you might get near or over 100 kft if you're down around 4-6 lbs and don't overfill).

The Kaymont chart isn't very helpful as it assumes a normal radiosonde weight. Spending about a half-hour on LiftWin will show you a lot more useful info.

5076. Re: [GPSL] Lift Question

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-02 20:34:08 UTC
From: Pete Lilja
Topic: 5069 Message: 5076

No - I just want to know which size balloon will hold enough gas to lift a given payload weight without overpurchasing a (too big) balloon for a typical ARHAB-type flight. The Kaymont chart lists several varying "lifts" and I was (still am) confused as to which to use to determine that.

Mark Conner has answered directly with 1200 grams balloons being a good size.

Have I really written these questions that unclear? Perhaps so - I do apologize.

I'll try to get some 1200 gram balloons.

Pete

You want to know how high it will get? is that what you're asking?

Paul recommended Hank Riley's LiftWin, and so do I. There's link to
download it on www.eoss.org - just hit the search for "liftwin".
This handy little app accepts your neck load and balloon model,
and you can enter min and max diameter if you need to tweak to
get a 1000 fpm ascent rate. It will also estimate the burst altitude.
If your initial balloon selection won't make your desired altitude
at 1000 fpm, then pick the next larger size.

Simple, huh?

EOSS has found LiftWin's computations to be pretty much dead on for
1200 gm balloon, but we use a bit lighter fill for 3000's - using
gross gas lift of 1.15 x the system gross weight (payload + balloon).
Fill a tare weight to gross lift minus balloon weight and pump gas
until the tare weight floats, being ever mindful of "false lift"
due to wind blowing over the top of the balloon - from whence the
EOSS Motto derives, "A Little More Gas".

The correct answer is to use LiftWin before you buy. You didn't mention
your payload weigt, so Mark was guessing 5 - 10 lb. If it's really just
2 lb, then you could get by just fine with a 600 or 800 gm bag. Getting
too large a balloon costs you money at purchase, and in fill gas to carry
the extra weight and finally in fuel to recover it way downrange.

Thanks, Mike, and all,

I now see where our disconnect is in my questions. You all were answering me just in a way I didn't anticipate and I was missing your point(s). Like often happens and with a fresh look I now see what you mean and I'll simply work out my payload / balloon in LiftWin.

Thanks again for your insight.

Pete

5081. Garmin Tour

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-03 17:06:29 UTC
From: L. Paul Verhage
Topic: 5081 Message: 5081

I just got word from Garmin that they don't do tours. So unless we have a Garmin emoployee on the list that can work something out, there won't be a Garmin tour at GPSL 2009.

You are going to find a lot of that in high tech industry. The US export control laws (EAR and ITAR) have gotten so strict that even showing a factory to a non-us citizen could be a violation of the law. It would be a big hastle to verify the citizenship of every tourist so no tours. We don't have tours here (Rockwell Collins) anymore because of this.

I don't think we're in Kansas anymore.

Aside from Zaggle, what online t-shirt companies have worked well for
people?

I got 55 of the BalloonSat Mini PCBs and 33 of the BalloonSat Easy PCBs.
I'll be making them available as solder kits shortly.

From: L. Paul Verhage
Topic: 5083 Message: 5085
Attachments: 3 described; binary payloads are missing from this source WARC

Attached are copies of the GPSL 2009 logo and first draft of the media announcement. I'd like to get the logo on the SuperLaunch website.

Please look over the first draft and let me know what else should be added. Right now I'm organizing it and listing the information. I'll wordsmith later.

I've also attached a picture of the BalloonSat Mini. I put one together last night as a test. This is a solder project for BalloonSat classes that allows participants to make their own BalloonSat flight computer. It uses a PICAXE-08M and can store around 180 measurements. I think of it as a next step after using a Hobo data logger. By the weekend, I'll assemble a BalloonSat Easy, a flight computer capable of storing kb's of data.

Both flight computers can operate cameras and collect analog data to 10 bits of resolution. They're pretty cheap, so they make a good replacement for a Hobo and 555 camera timer. Plus, you have to solder and program them. So they're a more complete experience.

5086. Balloon Launch

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-05 13:58:09 UTC
From: L. Paul Verhage
Topic: 4737 Message: 5086

I don't think KU has said anythign yet, so I will.

KU Aerospace engineering is planning a launch to test two tandum balloons. I'll donate a tracker, so one of the callsigns will be KD4STH. The frequency will be 144.390. Launch is scheduled for 7 AM this Saturday. The launch site is the soccer fields on the corner of 23rd and Iowa. The lift will come from two 1200 gram balloons. This configuration is test for a future rockoon flight. I'll get additional information and post it.

Might mention how many balloon groups are expected and/or mention how many groups attended previous GPSL's. How long GPSLs have been taking place might be of interest. Some of idea of the altitudes the balloons are expected to reach and how far and how long they'll fly may be of interest to the media.

The XBS group wants to launch a single payload on two side by side balloons. I'd encourage them to bypass that route and just launch a single larger balloon.

I agree, unless they did like we did with the seperator bar.

That was awesome while it lasted,,

cool thing tho was the recovery for it came down on the single left over balloon, one popped before the other, (even tho filled evenly)

and made locating it soo cool with the one balloon still 100 feet in the air,,,

5093. Re: [GPSL] Balloon Launch

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-07 00:43:21 UTC
From: Dan Bowen
Topic: 4737 Message: 5093

We had good luck using two 3000 g balloons when we tried for the altitude record on UX-3. They were very underinflated though, and only carried a 6lb payload. They were simply on two very long lines tied to the chute. Made it to ~115,000 if I recall.

Thanks,
Dan

5094. UAH Balloonsat flight complete and recovered - streaming video went well

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-08 00:44:01 UTC
From: wb8elk@aol.com
Topic: 5094 Message: 5094

The UAH Balloonsat flight is complete....payload landed near Fairmount, TN just north of Chattanooga, TN at: 35.2032 85.3085 .... it landed in the front yard of a house just off the road which is a good thing since it was pretty rugged and wooded terrain.

Max altitude was 99,016 feet.

This is the first time we attempted to show live Internet streaming video of the launch operations and the actual takeoff....everything worked well with comments that the video and audio looked great while inside the balloon highbay area....the video appeared somewhat washed out while outside during liftoff however since I was using the internal camera inside my laptop (I'll try to adjust the camera for the outdoors before going outside next time - or will try an external camera). We had about 8 simultaneous Internet viewers from across the country at one point and there is a nice chatroom space to the right of the image.

Streaming video details:

ASUS eeePC laptop with internal video camera and microphone
Wireless Internet connection - Verizon Wireless USB727
Adobe Media Encoder software (free download)
www.batc.tv (http://www.batc.tv) Members Streams (dedicated streams for members of the BATC)

Free alternatives that could be used: Camstreams or Ustream

The eeePC laptop is so lightweight I just carried it around and used it just like a camcorder....no cables to worry about....about 2 hours battery life is possible this way....if you're near enough to a WiFi link, you could eliminate the Verizon Wireless USB card as well.

I plan to do broadcasts like this on most of our future flights.

- Bill WB8ELK

Yeah, landing under a semi-filled balloon can be real neat - unless
it's windy - in which case, you could log two launches when the bottom
of the payload string breaks away on a fence line, thus unburdening the
balloon, which goes up again. Been there, done that, and ended up
recovering from 3 separate landing sites, 20, 30 and 45 miles downrange.
But we just gave it one EOSS flight number.

5096. Smart Beaconing with Byonics TinyTrak

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-09 22:55:19 UTC
From: BASE
Topic: 5096 Message: 5096

Dear friends,

Has anyone used the smart beaconing function on the TinyTrak from Byonics to transmit more frequently when stationary and less frequently when moving?

I don't need the GPS positions more often than every two minutes during the flight, but it would be nice to have a beacon every minute after landing to help in finding the pods if GPS lock is lost.

Thanks,
Howard

5097. Re: [GPSL] Smart Beaconing with Byonics TinyTrak

Not that, but I'm experimeint with the MicroTrak 300 and the ability to switch between two configuration settings. I have the flight computer set a pin high near flight apex to transmit beacons more frequently near burst and then again near landing.

Good evening Howard,

This won't answer your question about the TinyTrak, but for future reference the OpenTracker+ from Argentdata.com is able to switch profiles based on one or many parameters. A second, more frequent beacon rate could be set in the second profile which would be active below a certain altitude.

I'm curious to hear any responses to the smart beaconing. You may want to contact the gentlemen that developed smart beaconing at http://www.hamhud.net/hh2/smartbeacon.html

Sounds as though you need an independent DF beacon. A packet burst is too
short to take a DF bearing on. An independent beacon also covers you in case
the APRS beacon goes QRT.

5100. BASE 34 completed

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-12 22:14:27 UTC
From: BASE
Topic: 5100 Message: 5100

Dear friends,

BASE 34 was successfully completed today.

Launch: 13:52 UTC from DePauw
Burst: 15:20 UTC at 103,800 feet
Landing: 16:12 UTC between Potsdam and Laura, Ohio (39deg 58.78 min North, 84 deg 24.77 min West)

We had a visual sighting on the descent for the last two minutes. Smooth landing in the top of four trees about 60 feet above the ground. Retrieval was accomplished with the EZ Hang slingshot system using the tennis ball as the projectile. (Only took 4 attempts, with the first two being miserable failures due to operator error by me.)

The StratoStar system sent all the flight data to the mobile tracking station in real time.

Landing support from Ron, N9QGS, and Justin,W1IX.

Additional details will follow on www.depauw.edu/acad/physics/base

Howard

5101. Loran-C going thataway ...

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-14 05:27:06 UTC
From: Mike Manes
Topic: 5101 Message: 5101

EOSS's first on-board electronic navigation system used Loran-C. I think we still have that payload and ground station gear somewhere ...

Pity. Loran-C yielded some pretty accurate positions, but I guess GPS with WAAS really upstages it - at much lower cost and weight, and a LOT better reliability - not to mention 3D fixes.

Here's a clip from the 3/13/09 ARRL letter:

==> US COAST GUARD TO DISCONTINUE LORAN STATIONS

Last month, the US Coast Guard <http://www.uscg.mil/> announced that due to economic conditions, they would be closing down the 24 LORAN-C (Long Range Aid to Navigation) <http://www.navcen.uscg.gov/loran/default.htm> stations operated under the auspices of the USCG. LORAN stations provide navigation, location and timing services for both civil and military air, land and marine users. According to the USCG, LORAN-C is approved as an en route supplemental air navigation system for both Instrument Flight Rule (IFR) and Visual Flight Rule (VFR) operations. The LORAN-C system serves the 48 continental states, their coastal areas and parts of Alaska.

LORAN-A stations were developed beginning in World War II, and signals were transmitted on frequencies in and around our present-day 160 meter band. LORAN-A was responsible for reduced amateur radio operations, including frequency and power limitations, on 160 meters in the United States. In 1979, the Coast Guard phased out the LORAN-A stations; they were replaced by LORAN-C stations. The newer stations operated on 100 kHz, enabling the restrictions on the 160 meter amateur band due to LORAN functions, to be dropped.

According to the Coast Guard, the nation's oldest continuous sea-going service will continue to operate the current LORAN-C system through the end of fiscal year 2009; it is in the process of preparing detailed plans for implementing the fiscal year 2010 budget. According to USCG Vice Commandant and Chief Operating Officer Vice Admiral V. S. Crea, further details of the LORAN-C termination plan will be available upon the submission of the President's full budget. -- Some information provided by Cliff Appel, W7CGA

5102. Launch Date

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-16 19:11:52 UTC
From: Jeff Dailey
Topic: 5102 Message: 5102

We have a launch Thursday 3-19-2009.

Flight Information
Flight: HARP92
Flight Number: 146
Origination: Taylor University ATAIN Conference (Principles of Engineering Class)
Flight Locaction: Upland Indiana
Flight Time: 4:30PM
APRS: KB9ZNZ-11

Jeffrey F. Dailey
Center for Research & Innovation
Research Engineer

5103. Balloon launch from Columbus IN on Friday - Spaceport Indiana

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-18 05:09:43 UTC
From: wb8elk@aol.com
Topic: 5103 Message: 5103

Where: Columbus, Indiana airport (Spaceport Indiana building).
39.27N 85.90W

Date: March 20th (Friday)
Time: noon EDT

144.39 APRS: WB8ELK-11 and WB8ELK-12
144.34 RTTY & Hellscreiber (FM and SSB alternating)

possible HF transmitter on 14.077 MHz (RTTY, Hellscreiber, DominoEX and CW).

Streaming video starting around 10:30 am CDT:

www.batc.tv (http://www.batc.tv)

- click on MEMBERS STREAMS
- select WB8ELK
- click on "View Stream"

Bill WB8ELK

More details will be posted later this week on _www.wb8elk.com_

5104. Owe Someone a Thanks?

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-21 02:42:24 UTC
From: L. Paul Verhage
Topic: 5104 Message: 5104

I just got a message from Garmin. They would like to give GPSL a tour on Thursday. Is someone on the list a Garmin employee (and pulled some strings)?

I'll call Garmin on Monday and work out the details. So expect a Garmin tour to be on the list of events for GPSL.

Now to find helium and gas transportation.

I'll also get a list of Topeka activites for spouses who would like to visit Topeka.

5114. UAH Balloonsat Streaming video URL change for Sunday morning

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-29 06:24:21 UTC
From: wb8elk@aol.com
Topic: 5114 Message: 5114

The BATC has put my video stream for this Sunday morning's UAH BalloonSat flight onto their LIVE EVENTS link so please note it will NOT be on my WB8ELK Members Streams as previously reported.

http://www.batc.tv (http://www.batc.tv)

Then click on LIVE EVENTS on the left and select the Balloon Launch stream to view

We are meeting at the NSSTC building at 9:00 am CDT with liftoff between 30 minutes to 1 hour after that for the first balloon and the second balloon about 30 minutes later.

Streaming video will probably start around 9:15 am CDT (1415 UTC).

These flights may only go to 35,000 feet or so due to the flight profile they are testing and also to keep the landing in a good region near Henagar, AL....if the cutdown does not work then the landing zone is Dalton GA.

- Bill WB8ELK

KG4WSV-11 and KG4WSV-12 on 144.39

Uncertain if there will be room for the 144.34 multimode tracker at this time.

**********A Good Credit Score is 700 or Above. See yours in just 2 easy steps!

To: microwave@...

The reception of Amateur Radio signals bounced off the planet Venus is an
impressive achievement details of which can be seen at

http://www.southgatearc.org/news/march2009/eve.htm

It was done using the oldest digital mode CW coupled with modern SDR techniques.

A video showing Karl Meinzer DJ4ZC, Freddy ON6UG and the impressive 6 kW 2.4
GHz amplifier used to achieve Earth-Venus-Earth (EVE) can be seen at

http://tinyurl.com/EVE13cmAmp

The 2.4 GHz amplifier will be used by Radio Amateurs to sent signals to
control the P5-A Amateur Radio Mars spacecraft. On its journey to Mars it will
initially swing by Venus. The downlink will be on 10 GHz.

5117. All States and Launches

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-30 02:49:28 UTC
From: L. Paul Verhage
Topic: 5117 Message: 5117

Does anyone have new states they've launched from? I'd like to update my website with that information.

Also, I plan to launch in Lincoln next Saturday with NSTAR. My trackers will be KD4STH-11 and KD4STH. I'll transmit on 144.36 and 144.39. The balloon is a 1200 gram Kaymont.

The XBS group out of KU has expressed an interest on launching the following Sunday. If so, I'll be their backup tracker as KD4STH at 144.39.

Paul

Hi Pete,

We've done flight prep in the dark before sunrise, and one needs local floodlighting and flashlights for close work, e.g. tying knots. And a night recovery would make for more hazardous back-roads travel for the T&R teams an crummy descent and landing fotos. If you do use a conventional Xe arc strobe light, be sure to corona-proof it to 100K' - Norm's strobes used a baro switch to kill 'em above 60K' - the highest that the FAA cares about. I'm intrigued by the prospect of using the newer high power white LEDs in this service; this would eliminate the corona issue as well as reducing battery drain.

Hi Pete,

You might want to try illuminating the whole balloon envelope with a high-bright LED in the nozzle pointing up...would be interesting to see how that works, could actually have it do multi-colors and send a CW message visually...I've been meaning to do that in the very near future.

Dear Pete,

We've flown a couple of times with pre-dawn flights. Launch in darkness, recovery in early morning daylight.

The Lightman Xenon strobes operated throughout the flights without any problems. We had one strobe mounted in the spreader hoop of the parachute that pointed up toward the balloon and a second strobe aimed downward from a styrofoam block. The attached picture was from our last night launch that included four 1 W red LEDs on the bottom of the lowest pod. The picture shows the Moon on the right and captured both strobes on.

One problem that we encountered on both flights was GPS units freezing. Both flights had two Garmin 18 units and each flight had one unit drop out until fairly late in the descent. I'd encourage insulating the GPS .

Howard

We never had a GPS Freeze for dozens of flights, until we ran a strobe light,

We flew a regular high voltage uncredibly bright strobe on a flight and it messed up the GPS throughout the whole flight,

Position would lock, or spit out crazy readings like 1 minute later the balloon traveled 120 miles, or the best one was at one transmission the balloon was at 60 K feet, the next transmission it was 32,000 feet BELOW sea level!

Strobes must be kept a LONG way away from the gps.

Attachments: 1 described; binary payloads are missing from this source WARC

Although I appreciate Joe's comments that the GPS freezes could be strobe related. There is no evidence that the GPS freezes that I refer to on our flights were electrical. Our GPS units had no spurious readings throughout the flights. Our main flight computer tracks altitude readings every second with latitude and longitude data transmitted every 30 seconds. All readings were good except when the GPS was thermally cold.

The GPS simply stopped working when the ambient temperature reached -30 Celsius and returned to life after the ambient temperature rose to about -10 Celsius. Thank goodness for sunrise!

A second contraindicator of electrically induced problems is that on one flight the GPS closest to the strobes (about 10 feet away) performed throughout the flight while the one approximately 50 feet away stopped working during the coldest temperatures.

We never had a GPS Freeze for dozens of flights, until we ran a strobe
light,

We flew a regular high voltage uncredibly bright strobe on a flight and
it messed up the GPS throughout the whole flight,

Position would lock, or spit out crazy readings like 1 minute later
the balloon traveled 120 miles, or the best one was at one
transmission the balloon was at 60 K feet, the next transmission it
was 32,000 feet BELOW sea level!

Strobes must be kept a LONG way away from the gps.

BASE wrote:

Dear Pete,

We've flown a couple of times with pre-dawn flights. Launch in
darkness, recovery in early morning daylight.

The Lightman Xenon strobes operated throughout the flights without any problems. We had one strobe mounted in the spreader hoop of the parachute that pointed up toward the balloon and a second strobe aimed downward from a styrofoam block. The attached picture was from our last night launch that included four 1 W red LEDs on the bottom of the lowest pod. The picture shows the Moon on the right and captured both strobes on.

One problem that we encountered on both flights was GPS units freezing. Both flights had two Garmin 18 units and each flight had one unit drop out until fairly late in the descent. I'd encourage insulating the GPS .

Hi Pete,

  You might want to try illuminating the whole balloon envelope with a high-bright LED in the nozzle pointing up...would be interesting to see how that works, could actually have it do multi-colors and send a CW message visually...I' ve been meaning to do that in the very near future.

The GPS may have been getting gigged by corona discharge, which is hugely broadband. Corona also generates ozone, a strong oxidant, which can corrode metal and eat up insulation by cutting polymer bonds. It's easy to detect in an altitude chamber in a dark room - just look for the blue glow emanating from metal exposed to air. It's also possible to plain, flat arc over across the surface of insulation, creating a carbon track. See Ralph's discourse on corona and Paschen Law.

Fortunately, both corona and arc-over can be prevented by a liberal coating of insulation (corona dope or heavy acrylic spray paint) which keeps air far enough away from high voltage gradients.

Your Xe strobes may have been corona-free - as all that fly that high should be. Many aren't.

Mark,

The photo was taken by our campus photographer without any time stamp. However, based on comparative size of the balloon and the Moon, and a little trig (sloppy), the elevation was between 800 and 1000 feet.

5130. SO2 layers visible in recent balloon photos?

Yahoo group: GPSL (2009 — 2010)
Date: 2009-03-31 04:00:09 UTC
From: Mark Conner
Topic: 5130 Message: 5130

See http://spaceweather.com/submissions/large_image_popup.php?image_name=Brian-Whittaker-www-BrianWhittaker-com-Redoubt-Ash_1238432595.jpg for an aircraft example.

The recent eruptions of Mt Redoubt have produced some SO2 clouds that have drifted over the northcentral and northeastern US over the past week or so. I would have to review some of the satellite detections to see if it's possible that flights last weekend would have been able to see something. It's also possible that a flight this coming weekend might see something. For those who might be flying in the coming weeks, it would be worth checking any imagery closely for such evidence. Some suspected SO2 layers were observed in the skies over Wisconsin over the past weekend.

Mark,

The HALO II flights are also scheduled for this Saturday. If all goes well, there will be fifteen balloons flying simultaneously from Minnesota and Iowa east to New York. I'll pass the word to those that might be flying cameras or other detection equipment.

Near Space Ventures will launch a 1500g, Hydrogen filled High Altitude
Balloon on Sunday, April 5th, at aproxamatley 8:30a.m. Central
Daylight time
as part of an experiment sponsored by a high school student.

Launch Site:
Edgerton, KS @ 38.76184N, 095.00184W

Onboard APRS on 144.390Mhz,

Call Sign: WØNSV-11

You can follow the balloons location, altitude and speed from the
Internet by clicking on; http://aprs.fi/?call=w0nsv-11 after launch on
the day of the flight.

Simplex Repeater: 147.555Mhz/100PL --> The tone is critical to keep the
repeater out of APRS

Current flight prediction at; http://nearspaceventures.com/w3Baltrak/CurrMissionPlot.pl

5138. Passive SO2 detector

Yahoo group: GPSL (2009 — 2010)
Date: 2009-04-01 14:20:14 UTC
From: BASE
Topic: 5130 Message: 5138

Dear friends,

We're also considering flying a passive SO2 detector system using potassium permanganate based on the information from this link:

http://www.freepatentsonline.com/4277368.html

Other substances may trigger the color change, but it seems to be worth a try. If you have access to a chemistry department, it shouldn't be too hard to make a detector to attach to any box in your flight string.

If several of us flying this weekend (I think that there are about 18 flights on Ralph's list) could add this detector and not all of us see a reaction, then we might have additional evidence of the SO2 cloud.

Howard

Sounds like something interesting to experiment with. You should not really need a chemistry dept to make this sensor. Potassium permanganate is used in treating iron filters for water treatment and can often be found in stores selling water filtering supplies. I bought a bottle from my local Sears store. If you don't already have the silica gell you can probably get it from a craft store. It is used in making dried flowers. Jim Hannon

Subject: [GPSL] Passive SO2 detectorDear friends,
We're also considering flying a passive SO2 detector system using potassium permanganate based on the information from this link:
http://www.freepatentsonline.com/4277368.html
Other substances may trigger the color change, but it seems to be worth a try. If you have access to a chemistry department, it shouldn't be too hard to make a detector to attach to any box in your flight string.

I was able to get potassium permanaganate years ago at a drug store - it's a disinfectant/anti-fungal. It will stain fabric and skin, so use some caution when handling. Not terribly expensive (probably $10-15 in 1lb quantities).

A pool supply store is another location where you might be able to get some, as the iron filters mentioned below are also used for pools.

Just a simple question. How much helium do I need to get positive 7-8 pounds for 1500gm balloon?? which tank to rent?

Will try to launch 4th of April at 10-11AM EST from WIlkesboro, NC. Beacon will be at 144.430MHz, call sign KB2PNM-7

The LiftWin program by Hank N1LTV is what most of us use for this purpose:
http://www.geocities.com/n1ltv/newliftwin.htm

Most likely you'll want a T cylinder and won't use all of it. You may
need all of, or more than, the cubic footage in a K cylinder, but use
LiftWin to see how close you are.

5143. Enviromental Test Chamber

Yahoo group: GPSL (2009 — 2010)

From: L. Paul Verhage
Topic: 5143 Message: 5143
Attachments: 3 described; binary payloads are missing from this source WARC

Attached are the picture I've taken of the latest environmental test chamber. Inside is a bank of UV LEDs, a piece of radioactive china, and a resting platform for the experiment. The tank is stainless steel and packed on the outside with dry ice. I need to find some vacuum grease, I can only pump the chmaber down to 29 inch of Hg (as oppsoed to 30 inches for a perfect vacuum).

The chamber is packed with dry ice and chilling right now. As soon as my students come back from break, we'll load two flight computers inside and pump it down. I'm getting some video and pictures of the process.

If you hear a loud boom in the next 30 minutes, the tank ruptured.

Onwards and Upwards
Paul

As previously noted, DePauw is participating in HALO 2 with our BASE 35 mission.

Launch - 4 April 2009 1500 UTC (11 AM Eastern Daylight Time)
Location - Julian Science Center Roof, DePauw University
Balloon - 1200 gram Kaymont
Ascent Rate - 1200 - 1500 feet/min
Burst Altitude - 85000 feet
Landing - Greensburg, Indiana
Radios - 2 900 MHz spread spectrum
2 APRS at 144.39 MHz
KB9ZNZ-2 at even minutes + 15 seconds
W9YJ-11 at even minutes + 90 seconds
Experiments - Earth Sensor qualifier for Optical Energy Technologies
Optical Carbon Dioxide and Ozone Detectors
Sulfur Dioxide Detector (Silicon with Potassium Permaganate)
Tilt Axis Sensor
3 Digital Video Cameras
Small Air Filled Balloons
HALO 2 pod

The learning curve might be a little steep for a first "night before launch"
prediction. Either that or I was just a slow learner.

From: Mark Conner
Topic: 5148 Message: 5148

Having several balloons airborne and watching it in Google Earth is pretty cool. Go to aprs.fi and start Google Earth from there, then move your eye point to about 50,000 ft and look horizontally. Once the data loads, you should see tracks rising from the ground.

Hello AMSAT Community,

I am Nathaniel Bonton, the Sensor's subsystem leader for the Balloon III project. This is a project of the C.A.P.E (Cajun Advanced Picosatellite Experiment) organization located at the University of Louisiana at Lafayette. The Balloon III project is designing, programming and launching of a weather balloon to be released from the Lake Charles, La weather station. There are many different implementations such as: temperature sensors, slow scan TV, etc.

This brings me to the purpose of this post. I would like to ask anyone if they know of any one that was able to implement a slow scan TV on a weather balloon and if it is even feasible.

Thank you for your help and input.

Hi Nathaniel,

I'm working on a SSTV implementation on a microcontroller- controlled balloon transmitter and have it running Martin 1 mode at the moment. You can also fly the Kenwood VH-1 if you can find one on eBay. I also believe that Scott N1VG of Argent Data and Opentracker has come some ways in implementing SSTV on a microcontroller that could be used for balloons.

I'll probably be testing my SSTV balloon transmitter possibly as early as next Saturday on the next UAH BalloonSat.

5153. UAH and AAMU payloads launched and recovered - with extra bonus!!

Yahoo group: GPSL (2009 — 2010)
Date: 2009-04-04 21:04:52 UTC
From: wb8elk@aol.com
Topic: 5153 Message: 5153

There were 2 flights today, but 3 payloads recovered (more on that later in this email) - the third UAH team wasn't ready so will fly next Saturday morning after 9:30 am CDT....streaming video of that launch as before.

Today's flights have been recovered at the following coordinates:

Balloon 1 (UAH) - cutdown - landed at: 34.5827 84.9013 (located in a large field just east of Resaca, GA

Balloon 2 (AAMU) - flight to peak altitude - landed at: 34d 34.24m 84d 52.42m (also in a large field) - no tree climbing this weekend.

Even though both flights had a large ascent difference, thanks to the cutdown of the slow ascent flight, both landed very close to each other.

As an interesting bonus - I landed a payload last May 2008 (30m HF RTTY experiment) about 2000 feet south of where Balloon 2 landed today. Eddie WD4JEM found it back in May but couldn't retrieve it from its perch 70 feet up in the tree and it has been there ever since. Today, Kenny K4KR and Shane N4XWC continued on to my payload's location after recovering the university payloads. They found and recovered my HF payload sitting on the ground in plain sight underneath the tree where it had landed 11 months ago.

Considering this is nearly 100 miles downrange, what are the odds?

73s de Bill WB8ELK

To: balloon <knsp@yahoogroups.com>

A synopsis of the KWU night flight.

This was the 4th flight of the physics and math club working towards personal best of altitude and gaining experience in all aspects of ballooning.

A night flight was chosen to allow for more participation by students and local residents. The turn out for launching on the football field was great, more than 25 interested people showed up after hearing about it on the local AM radio station. The largest student group ever with about 15 at the launch and 10 in the chase vehicle were involved.
They are on to something by doing a night / evening launch rather than trying for early Saturday mornings. There was no real competition for everyone's time like there can be on a weekend, thus more participation.
Another plus was the relaxed atmosphere for prepping and release. The longer it took the more the winds diminished....

Winds did make things interesting during filling and release with a student doing a running start and releasing the payload when directly below the balloon. The surface winds made it hard to get a good reading on how much positive lift they had during filling and it ended up at ~600 fpm ascent rate. The students had used 1000fpm for the projections which put it on the West side of Topeka KS, instead it landed Northeast of Topeka, ~7 miles North of Oskaloosa, KS.

Students attached triangle shaped LED lights (3) on the payload, non blinking, and no strobes were used.
They used a 1200 gram balloon from Kaymont which over 5 years old. It was stored in its original sack and kept boxed for those years. No problems as the burst altitude was 101 + thousand feet.

The payload was found in a field right side up and the lights definitely aided in locating it.

Payload weight was 2.5 lbs and used a Micro-Trak 300 aprs transmitter with 300mw out to a dipole. The chase van used a mag mount vertical antenna, FT817, KPC3 tnc, and aprs+point software for tracking.

Hi Nathaniel,

EOSS has relayed slow-scan images through our balloon-borne cross-band repeater, and they came thru fine. We've looked at doing a SSTV payload, and even acquired a Kenwood VC-H1 SSTV modem for that purpose, but haven't got around to completing the project. I think this is probably the easiest route to that goal, however. The VC-H1 has been out of production for quite some time, but you may be able to find one used on the internet as we did. Ours was not cheap, however.

The VC-H1 is a "modem" in that it has a camera and SSTV audio generator for a multitude of SSTV modes, and it also has an SSTV audio demod and small color LCD image display. It just needs a radio to talk to as well as some means to trigger a picture. Since the SSTV receive capability wouldn't be needed, the radio receive audio could be used to detect an uplink trigger command, such as a unique tone or DTMF code and effect a shutter button closure on the VC-H1. A microcontroller, e.g Basic Stamp or PICAXE could also be used to fire off a pix at predetermined intervals.

5156. BASE 35 completed

Yahoo group: GPSL (2009 — 2010)
Date: 2009-04-04 22:28:40 UTC
From: BASE
Topic: 5156 Message: 5156

Dear friends,

BASE 35 has been successfully completed. Launch 15:06 UTC (due to system wide hold for HALO 2 fligths). Burst altitude: 86,000 feet Landing at Heading of 103 degrees and range of 70 miles.

Landing was interesting. Parachute caught in top of 100 foot tall tree with payloads hanging vertically from several horizontal branches. The lowest pod was about 60 feet above ground level. Four attempt with the EZ Hang successfully sent 1/2 oz. lead weight between the three payload strings connecting the lowest (HALO2) and second lowest (our light sensors and cameras) pods. We had a brief delay after the second unsuccessful attempt when the fishing line broke and there was not enough line available for another attempt. This shortfall was corrected by a trip to Greensburg for more line and sinkers. The EZ hang cord broke through the payload cords after pulling the payloads down to about 35 feet off the ground. All payloads except the HALO 2 were recovered with the Wonder Pole with the homemade hook. Another snare by the Wonder Pole brought down the HALO 2 pod.

More details will follow at www.depauw.edu/acad/physics/base

Thanks for your support,
Howard

NSTAR has flown SSTV on a few flights, using the Kenwood VC-H1. It's a lot of weight for no more than we do with it (make it transmit SSTV every 3 min) but the choices are somewhat limited. I made an adapter cable to go from the Kenwood plugs to the correct hookup for a Yaesu VX-1R. I got my VC-H1 as old dealer stock on the same day Columbia broke up over Texas - the guy who sold it to me told me it had happened and was the first I heard about it.

You will likely want to use another camera rather than the one that comes with it. After the first flight, we hooked ours to a camcorder with composite video out and got much better results.

We had very good reception at distances of at least 150 miles using a 600 mW transmitter on 2m and a Ringo Ranger or equivalent at the receive sites. Reception with regular mobile antennas in the chase vehicle is also very good. If your signal is good enough for AX.25 packet, it's plenty good enough for SSTV.

I wonder if we can record the images from GPSL 2009 and make a movie from it? It would be a nice thing to add to a CD of the conference we could make for everyone.

We've had some good results sending the VC-H1 on a balloon back in 1998 and 1999. Images were received 200 miles away with a 340 mW TX. We have a good shot of the balloon bursting at 114,600 feet. The VC-H1 was set for three minute intervals on Robot mode. The camera head was mounted to a servo that was commanded to rotate to one of three positions every three minutes.

From: Mark Conner
Topic: 5148 Message: 5160

Yes, you can.....

http://earth.google.com/userguide/v5/ug_movies.html

It would probably be best to record all the data and put it in KML
format, then set up a "tour" to view the data and capture the movie
that way. I think having the eye point move to follow the action
would be more interesting than a stationary view from some distance.
If I (ha ha) get a chance, I'll fiddle with this using some data from
GPSL 2002 or 2004, which I have somewhere for all the balloons that
flew.

The individual tracks would look something like the data I have posted at
http://nstar.org/index.php?option=com_content&view=article&id=87

From: Mark Conner
Topic: 5161 Message: 5161

I made contact with Keith at NSV. The NOAA site where they get the wind predictions is imposing some access restrictions. NSV is implementing this restriction by requiring a userid/password through the NSV website. There are some glitches but they're being worked. NSV hopes to have this sorted out early this week and will make an announcement when they are ready.

What was great that I was able to see balloon on landing, We were in the great spot and that thing flew just above us and .....landed in small, less than 1 ac. pond - what a luck !!!
That was good and bed, gondola opened, there was a little water inside, USB stick got wet, but after drying it is working great and I did not loose any data. Good of this landing - it was soft - water. Funny I had to borrow small boat from owner of the pond to retrieve by balloon.
That was really something
Thanks for help

5166. It's a Gas

Yahoo group: GPSL (2009 — 2010)
Date: 2009-04-06 15:37:54 UTC
From: L. Paul Verhage
Topic: 5166 Message: 5166

Kirk Welding will sell us T tanks of helium for $81.18 each and will have no problem deliverying 12 of them to my school. I need to set up an account with them first. At that time I'll also get the price of hydrogen.

So I guess I'm going to need to know how many heliums and how many hydrogens I need to order. I already have a couple of emails in this regard.

I have a volunteer from the local radio club who might be able to drive tanks around. But if it's a race day, he won't be able to help out. How many groups think they might be able to drive their tanks to the launch site if they can pick them up from my classroom the night before?

Thanks

By the way, the Hobo says the interior of the environmental chamber got to -80 *F. That's below it's minmum rating, so I don't know what that actually means. But dry ice has a temperature of -109 *F and it was in contact with the canister. Also, the temperature drop was smooth to -80 *F.

Topic: 5169 Message: 5169

Dear friends,

BASE will not be attending the GPSL this year.

I've been invited to provide the lift platform(s?) for the Space Jam-3 event at Chanute Air Museum in Rantoul, IL on the same day. This is a Scout activity, and the organizers knew about my Scouter and high altitude ballooning background. I just couldn't say no to the boys. This link will lead you to a brief flyer about the event (www.spacejamboree.com).

The organizers want to fly assorted HAM equipment. They like to fly two ATV systems (one camera aimed to the horizon and one to the ground). They also like to fly VHF/UHF repeater(s). I know that I'll rely on many of you for guidance in these matters. [I promise to get my Technician license before the event.]

We have discussed the possibility of floating or sending up multiple balloons. I know I'll be in touch with some of you about the float options.

Sorry to miss the activities in Topeka, but I look forward to 2010 in ???.

Howard

Hi Paul,

You could use a thermocouple and a DVM on the 200.0 mV DC range to get a fair measure of temperature down that low. I have a some Type J (Iron-Constantin) wire that I could send you. Just put the measurement ends into your DVM jack and add the DVM ambient to the thermocouple temp derived from the table in the Omega Temperature catalog or NBS Circular #561. At -80 C, Type J will read -3.8 mV dc, and the slope is about 0.5 mV/C.

My potter / bride uses this technique with DPM and #14 Type K in her kiln up to over +1200 C.

Date: 2009-04-07 00:22:54 UTC
From: Zack Clobes
Topic: 5172 Message: 5172

I've been cleaning out my basement and I found some more balloons that I might as well pass on, as it's going to be another year or two before we get back into it.

I found two 1000g Kaysam balloons, that are still sealed in box, and three 300g Kaysams. One of the 300g's is still sealed, and the others two boxes have been taped back together. If I remember right, I inflated them with compressed air at one point for an experiment. I don't believe that any of them have been abused at any point (over inflation, wet, cold, heat, sunlight, etc). The 300g's have a manufacture date of 02/2005. The 1000g's don't say, but were probably purchased at the same time.

If anyone can put these to use, make me a fair offer plus $15 shipping. I'd rather sell them as a single batch to simplify shipping.

Hi Paul,

ARBONET will need 2 bottles of helium. Do I need to send you some money before the meeting?

73,

Doug, W5BL

Subject: [GPSL] Environmental Chamber Test

By the way, the Hobo says the interior of the environmental chamber got to -80 *F. That's below it's minmum rating, so I don't know what that actually means. But dry ice has a temperature of -109 *F and it was in contact with the canister. Also, the temperature drop was smooth to -80 *F.

Hold off sending any money yet. I need to set up the account with Kirk Welding. Since I have class tonight, it won't happen until Wednesday at the earliest.

I'll need to place the DVM in the chamber since I have no way to pass wires out of the closed canister.

I've used teflon insulated feedthru terminal posts pressed into slightly undersized holes from the outside. They appear to seal well under vacuum.

Congrats Paul, that chamber sounds like it's really coming
along.

We've used thin threaded rod with washers and nuts (and a
goodly dollop of silicone caulk) to make electrical feed-throughs
for a plastic chamber we made a few years back. Seems to
work very well.

I think I'll experiment with that next. It seems like they would be easier to find. The article I'm putting together on the chamber will be published in Nuts and Volts and I don't want any part of it to require specialized components. I'm limiting myself to local hardware type of stuff.

As soon as I know my summer schedule, I'll arrange a visit for a launch.

Dear friends,

BASE will not be attending the GPSL this year.

I've been invited to provide the lift platform(s?) for the Space Jam-3 event at Chanute Air Museum in Rantoul, IL on the same day. This is a Scout activity, and the organizers knew about my Scouter and high altitude ballooning background. I just couldn't say no to the boys. This link will lead you to a brief flyer about the event (www.spacejamboree. com).

The organizers want to fly assorted HAM equipment. They like to fly two ATV systems (one camera aimed to the horizon and one to the ground). They also like to fly VHF/UHF repeater(s). I know that I'll rely on many of you for guidance in these matters. [I promise to get my Technician license before the event.]

We have discussed the possibility of floating or sending up multiple balloons. I know I'll be in touch with some of you about the float options.

Sorry to miss the activities in Topeka, but I look forward to 2010 in ???.

Howard

5186. ARHAB balloon dinner at the Dayton Hamvention?

Yahoo group: GPSL (2009 — 2010)
Date: 2009-04-09 00:43:02 UTC
From: wb8elk@aol.com
Topic: 5186 Message: 5186

The ARHAB Balloon Forum was a big hit last year at the Dayton Hamvention and drew a packed house in the large forum room.....sadly, they have badly messed up the Forums scheduling this year and have been losing emails with Forum requests...as a result of the Hamvention Forums Committee's chaos, they have not scheduled the Balloon Forum this year at the Dayton Hamvention even though I attempted to contact them nearly a dozen times to no avail or response....hopefully they will have fixed their email and internal communications problems and the way they schedule their forums by next year.

So....since there will be no Balloon Forum this year, I was wondering how many of you will be attending the Hamvention and whether you'd like to join us at the ATV Dinner on Friday night (since many of you also fly ATV on balloons)....or whether we would have enough interest to hold a Balloon Dinner on Saturday night after the Hamvention.

Let me know if any of you are interested in either option.

73s de Bill WB8ELK

PS....the ATV Dinner during the Hamvention will be held from 7pm to 10pm on Friday at Roush's Restaurant in Fairborn, Ohio.....there are always lots of door prizes.
A link with a map to the dinner can be found on my website: _www.wb8elk.com_ (http://www.wb8elk.com)

Paul,

Some changes in your document for EOSS.

We picked up one more for the tech session giving us a count of 12.

We upped our gas request in an email last week to two T-bottles.

We'll have 16 on the Garmin tour.

Looks like it's coming together for you. Nice work!

73,

Nick

Date: 2009-04-09 17:12:24 UTC
From: wb8elk@aol.com
Topic: 5190 Message: 5190

Hi Ralph,

As far as I know there will be 2 balloons...one will be cutdown at about 40k feet and one will go to burst just like last weekend....Launch just after 9:30 am CDT for the first balloon and an hour later for the last one.

The APRS trackers will be likely:

KG4WSV-11, KG4WSV-12 and KG4WSV-13

Also will fly the WB8ELK multi-mode tracker (FM/SSB) on 144.34 on the high altitude flight....(RTTY,CW and Hellscreiber).

Streaming video as before starting at 9:30 am CDT (1430 UTC) :

www.batc.tv (http://www.batc.tv) then click on LIVE EVENTS and select the Balloon Flight

Date: 2009-04-10 00:08:08 UTC
From: L. Paul Verhage
Topic: 5192 Message: 5192

Is anyone interested in purchasing a pressure sensor that runs from 0 to 15 PSI?

The SM5812 is at the end of its production and Silicon Micro Structures has said they'd sell the last of their stock (96 of them) for $10 each if I purchase all of them.

I've developed a weather station PCB for near space flights that uses the sensor and includes temperature and RH. My plan is to sell it as a kit to go along with the BalloonSat flight computers I'm mselling now (in the near future I'll also start selling kits of my two new complete flight computers - they incorporate radios)

However, there's no way I can afford to purchase $960 worth of material. So I'm interested in a bulk purchase so I can get some of them.

Hi Paul et al,

This is an OK absolute sensor (if that's what they're selling) - but its cumulative error is over 2.5% of full scale, which makes uncalibrated measurements at 100K' or 1% FS tough. Here's a link to the spec sheet:

http://www.si-micro.com/fileadmin/pdf/Datasheets/datasheet_SM5812_-_SM5852.pdf

If they are indeed P/N SM5812-15-A-3-x then put me down for 3 of 'em.

They're part number SM5812-015-A-3-LR
Is there an interest in purchasing a complete weather station for near space? It would include temperature, pressure, and RH. I suspect it would be less than $40. Plug it into a flight computer giving it 5V and ground and it will give you three analog voltages.

From: L. Paul Verhage
Topic: 5091 Message: 5197

The XBS group at KU is launching tomorrow morning at 7:00 AM. The launch site is the KU campus. One of my tracking capsules will go up as well the XBS capsule. I'll transmit at 144.39 under callsign KD4STH. I'll try to get XBS to post information on their capsule. The plan is to fly two 1200 gram balloons and use a cutdown to terminate the flight.

5198. XBS Launch

Yahoo group: GPSL (2009 — 2010)
Date: 2009-04-11 13:27:09 UTC
From: L. Paul Verhage
Topic: 5091 Message: 5198

I have a robot workshop to give, so I'm not on chase (in fact at the Dunn Bros coffee shop). XBS is transmitting at 144.420 under callsign K0KU-11. They launched two 2000 gram balloons with 7 lb lift each. The total payload weight was 10 pounds.

Interesting sight, the two balloons were pulled away from each other on ascent as if the air passing down them was pushing them apart.

5199. Odd Balloons

Yahoo group: GPSL (2009 — 2010)
Date: 2009-04-11 22:00:39 UTC
From: L. Paul Verhage
Topic: 5199 Message: 5199

The XBS flight went well, it reached 105,700 feet. Something we observed is that the two balloons remained apart from one another during the ascent. The balloons were tethered to the top of the parachute with 30 foot lines and remained apart from each other by 20 or so feet. They slowly rotated, but no where fast enough to create a centripedal force to keep them apart. I'll post a picture to the group so you can see. This appears to have occured for thousands of feet of the ascent.

What force can keep them apart like this? Curious minds want to know.

From: Zack Clobes
Topic: 5199 Message: 5200

I'm not sure how the balloons were connected, but I flew a pair once where I had a large one (1200g maybe?) and a smaller one (600g?). The larger one actually pulled the smaller up behind it. I chocked it up to the smaller one having less lift than the aerodynamic drag that the primary balloon was creating. I don't recall now how they were inflated in terms of lift pounds....

I ran a calculation last night.

The balloons where 2000 gram balloons and both filled to 7 pounds positive lift. The line between each balloon and the parachute was 30 feet long. From a picture, I calculate the balloons were 28 feet apart. That creates an angle of 29.5 degrees between each balloon and the center line. With 7 pounds pulling up, a force of 4 pounds was pulling each balloon horizontally. Since the balloons are roughly 6.5 feet in diameter, that creates a 2-D surface area of 33 square feet for a horizontal pressure to pull the balloons a part. Seven pounds acting over 33 square feet gives a pressure differential of 0.00147 PSI, or 1/1000 of an atmosphere acting horizontally on the balloons as they climb at 1,200 fpm.

If one assumes that the space between the balloons presents a flow obstruction that >reduces< the mass air flow in that region, then Bernoulli's Law would predict that the >static< pressure in that region would increase. Where does the "excess" airflow go? I'd suggest that it joins the flow passes around the outer periphery of the pair of balloons, thus increasing that airflow & thus reducing the static pressure at the periphery.

This is counterintuitive to those who recall the Bernoulli demo involving blowing between a pair of parallel suspended paper strips. So it may be unique to a pair of equal spheres attached just so in a specific range of Reynold's numbers.

Or not.

Anyone have access to a 3D Navier-Stokes FEM system?

I was wondering if the balloons were generating lift from the air flowing down them. However, it would seem that since the balloons rotate, the direction of the lift they generate should change over time. The result is that the distance between the balloons should change.

For the time we could see the balloons, they maintained their seperation. I'll get copy of the video XBS took from their module. That will show how the seperation between the balloons changed during the mission.

5204. Re: [GPSL] Odd Balloons

Yahoo group: GPSL (2009 — 2010)
Date: 2009-04-12 22:57:49 UTC
From: Mike Manes
Topic: 5199 Message: 5204

Ascending balloons generate drag due to air flowing down on the tops. This is why we pump excess lift in 'em. Now, perhaps you're thinking of a horizontal component of "lift" acting on the equatorial regions of the balloons - that's kind of my thinking as well. For a single balloon, that "lift" would be equal and opposite on the same structure, so the net effect would be null, other than perhaps to stretch the skin laterally a bit. But on a laterally-disposed pair, it would tend to separate 'em; this explanation works only if one assumes that the medial airflow is attenuated, however.

The phenom that Zack describes suggests that the low static pressure developed in the wake of an ascending balloon will suck smaller stuff inward - as in the case of his unequal pair. That effect would increase with balloon size.

Uh oh

I think I forsee see me trying to build a simple wind tunnel for testing balloon and parachute performance. That would get me another Nuts and Volts column. The tunnel would be vertical with a fan on top and a vacuum cleaner on the bottom. A thick bundle of drinking straws would help make the air flow laminar. Inside I could tether one or two toy helium balloons on thread. I could also flip it up side down to test parachutes. With a rheostat I could vary wind speed while testing parachutes and balloons of different diameters.

I better start reading abut Reynold's Number.

We have received word that Michael Gray, KD7LMO, was killed Sunday, April 12, ?while bicycling to visit his parents. This occurred about 3:30 P.M. on Maricopa Road near the Maricopa Fire Department. Initial information was that he was bicyling with two friends, when he was struck from behind by a drunk driver . Further information including that of Services, etc. will be forthcoming.

?

Michael will be sorely missed by his ANSR friends.

?

I've tried using a 3/4 HP furnace squirrel cage blower aimed upwards to test parachutes. It's >really< tough to get a broad, uniform airflow, even for a 1 ft diameter 'chute. I plan on using an array of toilet tissue cores to form a de-swirler - but I think it's gonna take more than that to simulate anything close to an actual descent. Towing behind a tall mast mounted on a vehicle on a deserted road may work better - although gravity is pointed the wrong direction.

Michael Gray's work on balloons and electronics has been an
inspiration and model for all of us in UTARC and I'm sure many other
groups as well. I don't know what part he played in the ~2006 ANSR
ZP mission with the anti-freeze bottle, but the software and hardware
used on that flight was the inspiration for most of our long duration
balloon flights in the UTARC/SNOX group.
I have always admired his clean, information-packed website
(kd7lmo.net) has always shown his top-quality electronics work and
dedication to amateur ballooning. He will be greatly missed.

EOSS flew a datalogger of mine, basically it was a BalloonSat Mini board, to record the temperature of a battery pack. Mike tweaked the code to make it better than what I sent. So now when it's turned on, it dumps its data in memory and then waits for a commit pin to be pulled before recording again. It has enough memory to record once a minute for an entire flight. It can log temperature data at eight bits or in a 10-bits compressed format. It operates from a nine volt battery and it's pretty small and light.

If you're interested in flying it, let me know and I'll ask Mike to send it to you. Feel free to modify the code, you'll need to download the PICAXE Editor (it's free).

I'd like to make this a data logger that various groups can borrow and pass around.

I've developed a LED photometer based on Forest's work and wrote about it in Nuts and Volts. The nice thing about using LEDs or photodiodes is that they don't require power. The PICAXE needs a voltage to digitize, so I'd have to four similar value resistors to generate the voltage from the photodiode current sources. Even if the photodiodes and resistors are matched, the software in the PICAXE can make adjustments before outputting a result.

Comparing the two designs side by side would make a neat Nuts and Volts article. Let me see what I can do.

They're not as sensitive as purpose-built phototransistors or CdS cells, based on development of optical detectors for status LEDs on the Canon camera used in SamCAm2. Cheap? Yeah.

5220. Airplane Strikes.

Yahoo group: GPSL (2009 — 2010)
Date: 2009-04-24 15:36:42 UTC
From: Joe
Topic: 5220 Message: 5220

Hi All,

Just been listening to WGN this morning and like wow, many people are always talking about worrying about one of our payloads getting hit by an aircraft.

I know we all then show the history that is Just has never happened even the hundreds flown by the weather service!

But i guess after the Hudson landing someone in congress or someplacvce anyway wanted a history of how often do bird hits happen and I was totally amazed!

The report says since 1990 there has beed a recorded 89,000 bird strikes! and probably over 100,000 is a more realistic number when non reported minor hits are added in.

and of the 89,000 hits, 2000 were serious enough to have the plane be concidered as being a total loss!

WOW!!

Paul and I have made arrangements to be one of the few sites in the U.S. to have a screening of the film BLAST! Please visit their website at http://www.BlastTheMovie.com/ for more information and I'm sure you will agree this is an exciting opportunity.

We will be showing this, most likely at the Kaw Area Technical School immediately after the Garmin tour. We will have to ask for a small donation to cover the cost, I'm guessing about $5 each, but I promise if we collect more than the cost we'll refund the difference.

If you have any questions, please let me know.

5222. Re: [GPSL] Airplane Strikes.

Yahoo group: GPSL (2009 — 2010)
Date: 2009-04-24 19:17:28 UTC
From: BASE
Topic: 5220 Message: 5222

Dear Joe,

I agree that the number of strikes is impressive. However, lack of a balloon plane collision is not surprising. There is a nice article about the height distribution of bird strikes, Height Distribution of Birds Recorded by Collisions with Civil Aircraft by RICHARD A. DOLBEER United States Department of Agriculture, Wildlife Services, Sandusky, OH 44870, USA

at this website:

http://digitalcommons.unl.edu/cgi/viewcontent.cgi?article=1496&context=icwdm_usdanwrc

Only 7% of the airstrikes occur above 3500 feet agl. Our balloon flights typically spend no more than 6-8 minutes below that altitude. Or you could say that we spend no more than 5% of our flight time in that altitude domain. Many birds spend in their entire lifetime below 3500 agl!

Of course the other major factor is that we don't launch that many balloons, especially directly in front of aircraft that are taking off or landing in the same immediate area. Many birds enjoy life in the open fields surrounding airports.

Consdiering the cross sectional area, it is more likely that a plane will hit the balloon rather than a payload package.

Having said all of that, I admit that I always say a quick "Thank you, Lord" every time we get above 60 kft! Considering that in the 35 flights that BASE has completed, I've already had one Interstate highway median landing (BASE 31) and one collision with truck traveling on a highway(BASE 23). The airplane encounter is only a matter of time!

Howard

Hi All,

Just been listening to WGN this morning and like wow, many people are

always talking about worrying about one of our payloads getting hit by

an aircraft.

I know we all then show the history that is Just has never happened even

the hundreds flown by the weather service!

But i guess after the Hudson landing someone in congress or someplacvce anyway wanted a history of how often do bird hits happen and I was totally amazed!

The report says since 1990 there has beed a recorded 89,000 bird strikes! and probably over 100,000 is a more realistic number when non reported minor hits are added in.

and of the 89,000 hits, 2000 were serious enough to have the plane be concidered as being a total loss!

WOW!!

We ahve had two interesting landing locations and one close flyby.

First the flyby

This was soo cool,, we were making our typical calls to Chicago center and was in conversation with the supervisor,, he said that he was seeing our radar reflector just fine,, That was cool enough but he then said that this is another video flight right? And it was he then said what way is the camera looking, and i described it and he said make it look down, and we did, he tghen says keep watching, keep watching get ready,,,, and all of a sudden we see a DC-10 fly by under the payload!! sooo cool he said it was about 3000 feet below the box at the time.. soo that was way cool,,

The other crazy was the landing least wanted,, yiou talk about an interstate median?? I'll raise ya one between two taxi ways at OHARE!!!! now that a spot to land!!!

I smacked a goose (I think) once at 300 kt on a low-level navigation training mission in a T-39. Never saw it coming - just a streak past the port side, a bump and some feathers jammed in the port elevator horn on postflight. One of the linemen was an amateur ornithologist who identified the species from the wing feathers. Five feet to the right and it coulda been a lot worse!

Hi Joe,

It musta been a slllllloooooowwwww day at Chicago Center if the controller was watching primary returns! Our waiver for heavies includes an exemption from flying a reflector, so long as we Igate APRS to aprs.org where they can track us in real time. Denver ARTCC only sees transponders, although they can turn primary returns on.

Yeah, those FAA controllers are just trying to get their jobs done, same as us. And some of 'em are great to work with. Although I've never spent 15 mins on the horn with 'em, one supervisor did call us after the first flight that we I-gated to his internet terminal to rave about how great that was compared to periodic position reports via cell phone. And one of the sector controllers was a ham and came out to one of our launches - the same one where I couldn't get decent cell service from AT&T :=P.

Buckley AFB is just a few miles from DIA, and I expect that they're tracking our primary returns just fine, despite our lack of a purpose-built reflector.

Temporary interruption in ARHAB Launch Announcement and Records updates
---

Our home took a lightning hit on Sunday. My PC, et al, were among the victims. DSL is back online
but for several days I will be using a small old PC that will have me barely on-the-air Internet-wise.

I will forward e-mail launch announcements I receive to Balloon-Sked.

I created a PB Wiki (for my instructional design course) for ARHAB. If you're interested in adding information to the wiki, let me know. I don't want to open the editing to the public, but will add anyone who expresses an interest.

It's just started and you'll find it at arhab.pbworks.com

5230. Several lots of 100g weather balloons on eBay now

Yahoo group: GPSL (2009 — 2010)
Date: 2009-04-30 03:41:21 UTC
From: Mark Conner
Topic: 5230 Message: 5230

There is a fairly new seller on eBay selling 10 100g red weather balloons for $35.50 which includes shipping. Expiration date on these balloons is March 08, not too bad. Anyone looking for small balloons for flights, demos, etc, can't go far wrong with this. Paypal is required though.

Also, a couple of other sellers with 30g pilot balloons for around the same price each, occasionally less if you get lucky on a bid. Also with not-terribly-old expiration dates.

A few weeks back I was able to snag two 1000g balloons for around $30 each, also with expiration dates of only a year old. It's certainly worth a weekly trip to eBay just to see what's on there. A couple years ago I got 10 1200g balloons at a heckuva deal.

[this should be authoritative - not sure I trust a flight-sim website for the latest info..... :)]

The free balloon exemptions are still in place. It appears there were other changes to FAR Part 101 made in late 2008, but not affecting ARHAB. The other language for non-exempt balloons has not been changed since 1974 according to the GPO website.

From: Dan Bowen
Topic: 5233 Message: 5235

Well that's good news, but it does bring to mind the possibility that
it could happen. Perhaps we should consider forming an association
like the NAR or AOPA to provide a unified political representation.
AOPA for that matter is a tremendous force in swaying FAA regulation.
It would behoove us to ensure that AOPA is on our side.

Thanks,
Dan

An organization like that would need big stake holders like research. We'd
be small fries in that pond.
Paul

exactly,,

Like our dozen or so groups out there, what clout do we have as to
compared to the thousands of pilots,

Nothing at all they all would just laugh at us, even if we had
involved EVEY balloon research group there is, how may people would that
end up with. the faa would just laugh at us.

From: Pete Lilja
Topic: 5233 Message: 5238

I'd agree, Dan. Often times these new regs are put in place and those that it effects find out too late. In addition to the NAR http://www.nar.org/ there is also the Tripoli Rocketry Association http://www.tripoli.org/ Both organizations keep up on watching new legislation that could impact the hobby. I am quite certain that TRA worked with the FAA on these new FAR101 regs.and made suggestions to make them more realistic and workable yet still meet the FAA's needs BEFORE they became law.

That being said a national (or international) HAB group would be very nice to have as a resource and a watchdog. But it is much easier said than done to create one.

I'd join the HAB Association of *Whatever*.

Well that's good news, but it does bring to mind the possibility that it could happen. Perhaps we should consider forming an association like the NAR or AOPA to provide a unified political representation. AOPA for that matter is a tremendous force in swaying FAA regulation. It would behoove us to ensure that AOPA is on our side.

Thanks,
Dan

I'm not so sure. TRA has only about 3000 members. Yes, probably larger than the HAB population but still a group with a common interest. I'd envision a HAB association as more of a resource for people to learn and share about HABing with a board of directors that would speak for the group in the interest of its mission. It doesn't need to be a big political force - simply a voice.

exactly,,

Like our dozen or so groups out there, what clout do we have as to compared to the thousands of pilots,

Nothing at all they all would just laugh at us, even if we had involved EVEY balloon research group there is, how may people would that end up with. the faa would just laugh at us.

[this should be authoritative - not sure I trust a flight-sim website for the latest info..... :)]

The free balloon exemptions are still in place. It appears there were other changes to FAR Part 101 made in late 2008, but not affecting ARHAB. The other language for non-exempt balloons has not been changed since 1974 according to the GPO website.

I fly high powered rockets in addition to an interest in HABs. There was a recent change in FAR 101 regarding rockets and the FAA. A fellow HP rocketeer and HAB enthusiast was looking over the new regs and noticed some seeming differences in FAR 101 regarding unmanned balloons.

The text of pps. 8 and 9 are copied below. Are these new regs we need to be concerned about? Or are those payloads under 6 lbs. still exempt? Is this new stuff (as it is with high power rockets)?

Subpart D-Unmanned Free Balloons

§ 101.31 Applicability.

This subpart applies to the operation of unmanned free balloons. However, a person operating an unmanned free balloon within a restricted area must comply only with §101.33 (d) and (e) and with any additional limitations that are imposed by the using or controlling agency, as appropriate.

§ 101.33 Operating limitations.

No person may operate an unmanned free balloon- (a) Unless otherwise authorized by ATC, below 2,000 feet above the surface within the lateral boundaries of the surface areas of Class B, Class C, Class D, or Class E airspace designated for an airport; (b) At any altitude where there are clouds or obscuring phenomena of more than five-tenths coverage; (c) At any altitude below 60,000 feet standard pressure altitude where the horizontal visibility is less than five miles;

(d) During the first 1,000 feet of ascent, over a congested area of a city, town, or settlement or an open-air assembly of persons not associated with the operation; or

(e) In such a manner that impact of the balloon, or part thereof including its payload, with the surface creates a hazard to persons or property not associated with the operation. [Doc. No. 1457, 29 FR 47, Jan. 3, 1964, as amended by Amdt. 101-5, 56 FR 65662, Dec. 17, 1991]

§ 101.35 Equipment and marking requirements.

(a) No person may operate an unmanned free balloon unless- (1) It is equipped with at least two payload cut-down systems or devices that operate independently of each other; (2) At least two methods, systems, devices, or combinations thereof, that function independently of each other, are employed for terminating the flight of the balloon envelope; and (3) The balloon envelope is equipped with a radar reflective device(s) or material that will present an echo to surface radar operating in the 200 MHz to 2700 MHz frequency range. The operator shall activate the appropriate devices required by paragraphs (a) (1) and (2) of this section when weather conditions are less than those prescribed for operation under this subpart, or if a malfunction or any other reason makes the further operation hazardous

to other air traffic or to persons and property on the surface. (b) No person may operate an unmanned free balloon below 60,000 feet standard pressure altitude between sunset and sunrise (as corrected to the altitude of operation) unless the balloon and its attachments and payload, whether or not they become separated during the operation, are equipped with lights that are visible for at least 5 miles and have a flash frequency of at least 40, and not more than 100, cycles per minute. (c) No person may operate an unmanned free balloon that is equipped with a trailing antenna that requires an impact force of more than 50 pounds to break it at any point, unless the antenna has colored pennants or streamers that are attached at not more than 50 foot intervals and that are visible for at least one mile. (d) No person may operate between sunrise and sunset an unmanned free balloon that is equipped with a suspension device (other than a highly conspicuously colored open parachute) more than 50 feet along, unless the suspension device is colored in alternate bands of high conspicuity colors or has colored pennants or streamers attached which are visible for at least one mile. (Sec. 6(c), Department of Transportation Act (49 U.S.C. 1655(c))) [Doc. No. 1457, 29 FR 47, Jan. 3, 1964, as amended by Amdt. 101-2, 32 FR 5254, Mar. 29, 1967; Amdt. 101-4, 39 FR 22252, June 21, 1974]

§ 101.37 Notice requirements.

(a)

Prelaunch notice: Except as provided in paragraph (b) of this section, no person may operate an unmanned free balloon unless, within 6 to 24 hours before beginning the operation, he gives the following information to the FAA ATC facility that is nearest to the place of intended operation: (1) The balloon identification. (2) The estimated date and time of launching, amended as necessary to remain within plus or minus 30 minutes. (3) The location of the launching site.

I think a national organization would be neat, but would be limited in power. Perhaps it would do things like bulk purchases, conferences, newsletters, maintain records, etc. Basically it would be what we are now.

I think one of the big problems is that there is really no industry that is dedicated to AHAB. Sure, there are APRS tracker and balloon manufacturers out there, but we're not their biggest customers, where as companies like Aerotech have a lot riding on how easy it is for their customers to pursue their hobby.

5244. Re: [GPSL] Re: [Balloon_Sked] Different HAB Regs?

Yahoo group: GPSL (2009 — 2010)
Date: 2009-05-01 16:40:52 UTC
From: Pete Lilja
Topic: 5233 Message: 5244

That may be true. But how does that change the desirability of a HAB organization? Jugglers have the International Jugglers' Association http://www.juggle.org/ simply for the common interest of the group, as a resource, a magazine and to be the group that organizes their annual festival. Many groups have organizations to bring together those with a common interest - not just to watch for regulations.

Aerotech as a company doesn't belong to TRA. It does, yes, have a vested interest in people learning about rocketry but TRA would exist without Aerotech (or any other manufacturer).

Pete

Subject: Re: [GPSL] Re: [Balloon_Sked] Different HAB Regs?

I think one of the big problems is that there is
really no industry that is dedicated to AHAB. Sure, there are
APRS tracker and balloon manufacturers out there, but we're not
their biggest customers, where as companies like Aerotech have
a lot riding on how easy it is for their customers to pursue their
hobby.

yup

And really, Yes i was into rocketry, never into it like the big guys are, like with the "P" mototrs and all that,

But after doing these balloons for 20+ years now i have just lost all interest in the rocketry aspect.

I look at the money some of these people spen on a GIANT rocket like 10K and then some and are all excited that it reached 5K feet!! man i can't imagine wht type of balloon payload flight i could make for 10 grand, and i know it will exceed 5 k for sure!

Whoa!! I use to belong to IJA. That was back in my USAF days. I was stationed at the Pentagon and in downtown DC was the only juggling store I had ever seen.

If we created a national organization, I'd like to see GPSL become its national conference (with a name change?). I also think Ralph should be its official historian.

It's funny to see how much money roceteers spend to reach one mile.

Somehow, I think rocketry is a Freudian thing (long and cylinderical, smoke, flame, noise, etc).

It wouldn't change the desirability any, I was just thinking of bargaining position. I.e., if the FAA is causing problems for a particular company, a person could go to the senator from the state where that company lives and say, "Hey, FAA's doing something that is hurting company X, which happens to employ voters in your state".

If company X's core business is represented by your organziation, that gives you more clout with the senator than if HAB only represents 0.01% of company X's business.

Just thinking out loud here.

>
> That may be true. But how does that change the desirability of a HAB organization? Jugglers have the International Jugglers' Association http://www.juggle.org/ simply for the common interest of the group, as a resource, a magazine and to be the group that organizes their annual festival. Many groups have organizations to bring together those with a common interest - not just to watch for regulations.

Yeah, rockets can be expensive. One reason I like ballooning! Check out the 1/10 scale Saturn V that launched last Saturday. http://www.rocketsmagazine.com/saturn-v-project/launch/ That was nearly $30K in the rocket and motors to go 4,000'! It did weigh 1600 lbs., though. I just read about a guy that is building a full scale Mercury Redstone - that's 83' tall! And he's done enough successful large projects that he'll likely succeed. Wedge Oldham is his name if you'd like to Google what he's done.

That compensating for something else joke has been used many times, Paul. 8-)

It's just a suggestion / thought as to forming an organization. For the beginner (me included) it would be nice to have that as a resource to learn and advance. There is a lot of information on the 'net but can be a little difficult to gather at the beginning.

If nothing else, perhaps a subgroup of the ARRL would be a way to get it going. I dunno. I'm just a rookie in ALL of this stuff.

yup

And really, Yes i was into rocketry, never into it like the big guys are, like with the "P" mototrs and all that,

But after doing these balloons for 20+ years now i have just lost all interest in the rocketry aspect.

I look at the money some of these people spen on a GIANT rocket like 10K and then some and are all excited that it reached 5K feet!! man i can't imagine wht type of balloon payload flight i could make for 10 grand, and i know it will exceed 5 k for sure!

In addition to the NAR http://www.nar.org/ there is also the Tripoli Rocketry Association http://www.tripoli.org/ Both organizations keep up on watching new legislation that could impact the hobby. I am quite certain that TRA worked with the FAA on these new FAR101 regs.and made suggestions to make them more realistic and workable yet still meet the FAA's needs BEFORE they became law.

That being said a national (or international) HAB group would be very nice to have as a resource and a watchdog. But it is much easier said than done to create one.

I'd join the HAB Association of *Whatever*.

Well that's good news, but it does bring to mind the possibility that it could happen. Perhaps we should consider forming an association like the NAR or AOPA to provide a unified political representation. AOPA for that matter is a tremendous force in swaying FAA regulation. It would behoove us to ensure that AOPA is on our side.

Thanks,
Dan

When we started balloon flights back in 1998, EOSS is the
organization that helped us out the most. We used their
handbook as our blueprint for many years, and to this day
I send people to their website (and Ralph Wallio's, and GPSL)
for more information on AHAB.

I thought either ARRL or AMSAT used to have a balloon subgroup,
but decided to let it go. Does anyone else remember that, or
am I imagining things?

I've talked to Pat (of SimSat) with AMSAT recently. There appears to be very little interest from AMSAT in near space. I would argue that near space is the kind of thing they should be involved with, it's one step from space (although it is a pretty big step).

That is disappointing. Did he give any reason for it? With all
the similar engineering challenges, I'd think they would promote it
as a stepping stone to spacecraft if nothing else.

(Oh, and Paul, I send people to your website as well :-).

From: L. Paul Verhage
Topic: 5233 Message: 5255

Pat Kilroy is trying to set something up, but it seems the current AMSAT leaders (board?) has enough on their hands with their current satellite plans.

On Fri, May 1, 2009 at 1:56 PM, John Nordlie <nordlie@...> wrote:

Date: 2009-05-01 20:12:54 UTC
From: Joe
Topic: 5233 Message: 5256

Hi Paul, AND EVERYONE!!!

Yes I just don't understand why people are not beating down our doors to do flights for them,,

Yes I have done some test flights for some NASA guys, and a group that was going after the X Prize. But where we would shine is in places like Middle and high schools. Like Chuck did with Windtrax.

But at least here in Wisconsin, Unles you are a part of the University of Wisconsin system you do not know anything at all.

Just a year ago or so we did a fantastic balloon flight for several thousand students and countless of the general public at a celebration of 50 years of spaceflight celebrating 50 years of bla bla bla, it was at a local school that i tried ohh ten years ago to bring a program like we can do for them with no results what so ever, the only reason it probably happened is because I knoew the teacher that was in charge of the whole program, and he lerned to belive what we can offer because he was at a flight we did at a star party.. he even admitted that when he first heard of this he did not belive what we do and what can be done. till he actually seen a flight..

Get this everyone,, About two weeks ago I sent a blanket message out (It is below) to all the local high schools, Every science teacher, principal, assistant principal, electronics teachers, computer teachers etc. it went out to 67 different people. And tomorrow it will be three weeks since i did this mailing and NOT ONE SINGLE REPLY!!!

At the sputnik celebration they had an astronaut give a nice talk, but later he hunted me down and said I have been looking for you all day and talked about the balloon program.. And how he thinks it is soo incredible, and how he wished there was someone like this when he was in school..
heres is that message I sent out..

Mr. Wong,
My name is Joe Mayenschein. My son Chris went to the Hillsboro School system for most of his life. He did move to Wonewoc before graduation tho.

But that is not the reason I am contacting you this afternoon.

I am the founder and mission director of a program we are proud to call "Near Space Sciences"

We would like to Bring Wisconsin's very own Space Program "Near Space Sciences" to your school.

Imagine if you were able to come up with a concept of a space satellite. Then design, build, and actually launch it to the, EDGE OF SPACE!
A typical payload can reach altitudes that look like this!
(Picture deleted for now you all know what the pictures from altitude look like..)
This picture was taken during a flight we had for several hundred boy & girl scouts two years ago at the Sauk County fairgrounds. The picture was taken at about 2 PM in the afternoon, notice the curvature of the Earth, the Inky blackness of the sky, as well as the beautiful Blue cloud dappled Earth below! You can see the haze of the thin atmosphere on the horizon. And the sky is inky black as it is in Space because the payload for all practicable reasons IS in space. When this picture was taken the payload was above 99.5% of the Earths Atmosphere! Less than 1/2 of one percent remains.!

A short You Tube video of liftoff of this flight for the Boy & Girl scouts can be seen here.
http://www.youtube.com/watch?v=NoUkgWOUbNQ

We are one of the several originators in the world of this Amateur Based Near Space Research programs like these. This year is our 21st year doing these flights to the "Edge Of Space" We had our first flight in the summer of 1988.
A somewhat outdated web page of ours can be seen at,
http://www.qsl.net/wb9sbd/educators.html

A year ago last October, (October 23rd to be exact) we had our 45th flight for over a thousand students from all over southwest Wisconsin as well as thousands more of the general public! It was at an event called "October Skies" Where we were in celebration of the 50th anniversary of the launch of Sputnik, and man's exploration of Space! It was held at the Richland Center High School. The "October Skies" flight, this one was a pretty exciting flight, we had a GPS system on-board that allowed us to track the payload throughout it's flight. At all times we knew it's exact location, Altitude, as well as speed and direction it was moving.

Also onboard was a radio communications repeater station again (you'll hear someone talking through the balloon in the video) but the best part was a full LIVE TELEVISION SYSTEM onboard transmitting the view from the payload back to the ground.

Here is another Video of the Richland Center High Schools "October Skies" liftoff of their payload as well as other activities held during that day. it can be seen at,

http://www.cqtube.com/video/59/nss-45

and here is the view of liftoff from the payload itself.

http://www.youtube.com/watch?v=XXfNJoLLpI8

A web page I started (just haven't finished yet) that is a detailed
story as to how this flight came to be. I'm not too sure if the school
made any pages for it but for Near Space Sciences own records I started
making the one for this flight it can be seen at, the address below. It
not only shown what we went through to make this happen, but how many ,
MANY different classes in the school can be involved with these flights.
The page is at.

http://www.qsl.net/wb9sbd/nss-45.html

We would just love to be able to bring our program like this to the
Hillsboro High School.

Looking Forward to hear what your thoughts are.

Joe Mayenschein
Near Space Sciences

not one single reply, not even a No, Thank You, Just total nothing..

It just amazes me..

Sad thing is tho way in the beginning 20 years ago the AMSAT gang was enthusiastic supporters of these missions, I remember getting a LOT of support from them,, They all thought of our flights as a very short and very low orbit bird.

Hi Joe,

Your posting sounds a lot like what I've gone through over the past several years. It seems that most teachers are stuck with the current curriculum and are afraid to step out and reach for something new. It's really a shame! When my son was in Elem. school, he had one teacher that allowed me to set up a camera during a solar eclipse and pipe the video into a big screen in the classroom. She also allowed me to demonstrate a contact with the MIR space station. That was the only teacher in the whole school system that was ever interested.

As far as AMSAT goes, it's pretty sad that they spend so much energy on big $$$ projects and not enough at the grassroots level.

Joe and friends,

I have found that the schools are more willing to work with us when I can point to specific academic (science) standards that have been established for their grade level by our state department of education. In Indiana, this means that it is easier to fly in high schools with an Earth Science class than with an advanced chemistry or physics class. To fly with fourth graders emphasize air, wind, and weather, with fifth graders - fly an experiment that looks at changes in matter during and after a flight.

Last year, even with standard identification, our offer to fly was only accepted by 10 teachers out of a a pool of 150+.

Howard

Thing is also

you would think they would JUMP at a chance to do something this cool
and it COSTS THEM NOTHING!!!

Thats what the Astronaut also asked me, How much did I charge the
school to do this flight, and he almost died when I told him it's free.
He said if he was an educator in charge and seen a program like this
he'd be willing to pay thousands per flight, Of course we can accept
payment, but this demonstrates the value we offer but to be ignored..

From: Ed Moore
Topic: 5233 Message: 5263

Our experiences here in the UK tally somewhat.

It's tough for schools, teachers are afraid of taking risks - it usually costs them a lot of credance with other staff/principals if the experiment isn't a success. Whilst the cost of a mission is £60 for a balloon, £30 for helium and a tank of gas to go and get it, the cost for supply teachers to cover at the school when other teachers and kids go ballooning is maybe five times that.

We were lucky enough to work with a very forward thinking, innovative teacher, but I personally saw the risks he took and the favours he pulled in to get the school to agree to an experiment with us. And whilst we'll never know, I get the impression it would have set things back for him had the experiment not worked.

Anyway, in the end it was pretty successful and we all had a blast, and it's now a much easier 'sell' the concept to other schools and education authorities as a result. Here is some coverage of what we did:

http://news.bbc.co.uk/1/hi/sci/tech/7767376.stm
http://www.timesonline.co.uk/tol/news/uk/science/article5289142.ece

I think the trick is, as you say, to find the specific teacher and work with them. Now we have a teacher on side who we can point other understandable conservative, skeptical teachers towards, who can vouch for the project from their point of view, and who understands their concerns and the pressures they work under.

Keep pushing, it's worth it.

From: L. Paul Verhage
Topic: 5265 Message: 5265

I'll drive to Gretna, NE on Sunday to do a launch with NSTAR. My balloon will carry two trackers. KD4STH-11 is transmitting at 144.390. KD4STH-9 is transmitting at 144.360 at 15s after the minute. The balloon is 1,000g and will have 11 pounds of lift.

Fat chance. AOPA would prefer to have the NAS all to itself. If you browse into the comments submitted on NPRMs that created Subpart D, that's pretty clear. Not sure where you'd find that on the web, tho. I have an n-th gen hardcopy. The NWS would be a more reliable ally.

However, it would be nice to have a national organization that can represent the interests of ARHAB before the FAA, IMHO, kinda like ARRL for ham radio. Others understandably disagree, however.

"We can all hang together, or hang separately", Ben Franklin (?) ca 1770.

So, how many of you submitted comments to the FAA's NPRM re UAV's, which, when read strictly, bans unmanned balloons that fly above 700 AGL?

I think Kaymont Ind's and AirGas aren't offended by our purchases.
Expendables for a single 3000 gm "heavy" run upwards of $500 a pop.

Hi Paul,

Actually there are many folks in AMSAT who have an interest in Near Space....I attended the AMSAT conference last October in Atlanta and presented a talk on Near Space and using it as a way to test out satellite transponders....there was another talk that included Near Space from the Auburn folks and yet another group from Miami talked about balloons as a stepping stone to satellite payload research. I discussed flying an SDR (software defined radio) system similar to that going up in SuitSat2 on a balloon and that received some interest in doing that as well.

AMSAT actually does have a NearSpace link on their website but it hasn't been updated for awhile.

As to working with the FAA....EOSS has a great relationship with the FAA and if any rule changes are forthcoming....we could start with that relationship.....also I attended a conference in Iowa a couple years ago that was focused on Near Space....there are several big companies that operate under Part 101....Space Data...and NearSpace Corp....I'm certain that they both have a voice and some clout as any changes to Part 101 would tremendously affect them. At that Smallstat conference I talked with the fellow who heads the FAA department that deals with scientific and sounding balloons (he presented a talk about the possibility of balloons striking aircraft)......a handful of near misses and one possible strike with no damage after 60 years of ballooning.....he's a very approachable and open person...I'll look up his contact info. However, I'd advise not asking for clarifications or updates to the rules unless we get word that there appears to be a rule change in the works since government rule changes usually are MORE restrictive than less.

5271. Expensive balloons with rockets

Yahoo group: GPSL (2009 — 2010)
Date: 2009-05-03 08:55:29 UTC
From: wb8elk@aol.com
Topic: 5271 Message: 5271

One of the comments in the recent thread about HAB regulations was "wonder what 10,000 dollars worth of balloon would look like?".

Well...here you go:

This was our Project HALO CATS prize and X Prize contenders. It was a 400 pound rocket launched from a balloon at 75,000 feet (Rockoon)....a lot of the expense was the large boat rental as we weren't allowed to launch over the continental US and had to be at least 200 miles out to sea in the Gulf of Mexico... _www.harcspace.com_ (http://www.harcspace.com)

_http://www.youtube.com/watch?v=-1bGNTqOzGI&feature=channel_page_ (http://www.youtube.com/watch?v=-1bGNTqOzGI&feature=channel_page)

This is the actual launch of the rocket ignited via a VHF uplink command while it was about 15 miles from the boat and 75,000 feet high...2.4 GHz video downlink.

http://www.youtube.com/watch?v=eFp2Gg3cyTo&feature=related (http://www.youtube.com/watch?v=eFp2Gg3cyTo&feature=related)

Also...there are some nice videos about some government Rockoons in the 60's that also included a nuclear device that they detonated in the stratosphere....hmmm...wonder what the FAA regs are on carrying nuclear devices aloft???

http://www.youtube.com/watch?v=N8KrEvT-wYQ (http://www.youtube.com/watch?v=N8KrEvT-wYQ)

and

5273. Re: [GPSL] Several lots of 100g weather balloons on eBay now

Yahoo group: GPSL (2009 — 2010)
Date: 2009-05-03 17:01:57 UTC
From: Zack Clobes
Topic: 5230 Message: 5273

I'm not sure if my original message made it to the group or not, but I still have some 1000's and 300's for sale too.

*I've been cleaning out my basement and I found some more balloons that I might as well pass on, as it's going to be another year or two before we get back into it.

I found two 1000g Kaysam balloons, that are still sealed in box, and three 300g Kaysams. One of the 300g's is still sealed, and the others two boxes have been taped back together. If I remember right, I inflated them with compressed air at one point for an experiment. I don't believe that any of them have been abused at any point (over inflation, wet, cold, heat, sunlight, etc). The 300g's have a manufacture date of 02/2005. The 1000g's don't say, but were probably purchased at the same time.

If anyone can put these to use, make me a fair offer plus $15 shipping. I'd rather sell them as a single batch to simplify shipping.

Ralph,

While I am sorry to read this I do understand that it is probably a rather time consuming venture for you and it is time for you to move on. I feel fortunate to have been able to meet you and speak with you briefly at the Hamfest in Des Moines a couple of weeks ago (I am the guy that overheard your name mentioned and then introduced myself).

If no one steps forward to take over your duties might I suggest the ARHAB enthusiasts create an online message board where individuals can post their own launch announcements as well as a meeting place for discussion of HABing. I belong to a rocketry group that uses http://www.yuku.com/ which works pretty well. It can be free but you have to suffer through advertisements. For a fee that users can donate to through the web site the ads are eliminated.

Just my 2¢ worth.

Thanks again, Ralph. Your efforts have been appreciated over the years.

Ralph, I appreciate what you have done for us. ARHAB is much better because of your hard work. I imagine it was also some what thankless. I would like to see a special recognition for Ralph at GPSL this year.

Basically we have lost two greats this year.

Paul

Ralph, your dedication and service to ARHAB will be greatly missed. Your help has been invaluable to NSTAR over the past several years.

A more-or-less offhand comment by Ralph recently led me off on a Google rabbit trail that may have paid off. On our NSTAR flight over the weekend, we got several photos of Paul's balloon which was a few thousand feet above us and 3-7 miles away. The balloon occupied maybe 9 pixels out of 7 million, but was definitely the balloon and not an image artifact. Ralph mentioned that all we needed to do now was to come up with a means to aim and zoom a camera to a balloon's location.

This seemed a tractable problem for ARHAB (i.e., within a reasonable budget, sufficient off-the-shelf components, enough accuracy to meet not-too-stringent requirements). So I started off investigating compasses, gyroscopes, and 6-degrees-of-freedom IMUs. All we really need is a way to sense pitch and yaw, or 2 degrees of freedom. Roll is immaterial and and X/Y/Z can be supplied to the necessary accuracy by a GPS. However, there does not seem to be a good way of reliably getting pitch and yaw information on a platform that moves in 3D and undergoes all sorts of complex motions over a period of a couple of hours (gyro drift, accumulated IMU errors, etc). It's possible hobby-grade IMUs can do this, but I couldn't find reliable info either way.

Yaw (azimuth) should be obtainable well enough by a compass - unless zoom values are extreme, pointing accuracy of 1-2 degrees is probably OK. However, having a platform that can tilt complicates it. I found this little sensor that could provide tilt correction:

http://fmadirect.com/detail.htm?item=1489§ion=20

applied to a R/C-mounted camera:
http://diydrones.com/profiles/blog/show?id=705844%3ABlogPost%3A2525

This senses the infrared differences between sky and earth and corrects R/C aircraft servos to compensate, attempting to keep pitch and roll level. I'll have to read more details, but I think one could connect this to a pair of servos to keep a camera pitch level. Yaw information could be obtained from a compass and thus you could have a platform that would point to a constant compass heading at the horizon. With some offsets applied, you could have it point a set number of degrees above or below the horizon. With a GPS and some trig, you should be able to have it point to a 3D location (or set of locations) for the entire flight. Incorporate an APRS receiver and you could have it track a moving target.

One issue I see is that the unit does not appear to work with digital servos. Not sure how much of a limitation this is yet.

Anyway, I thought I'd throw this out there for comments and ideas.

I have been working on this problem of tracking and stabilizing a camera for the past year. I have had some good success and failures. Recently I incorporated a PNI sensor that was generous donate to me. It is a highly accurate 3 axis digital compass (0.01 roll/0.1 pitch) and I believe once I have it incorporated with my current sensors that a camera should be able to maintain its position in wind conditions that do not exceed the servo operation speeds.

I will be updating my website on my progress shortly but in brief I have completed the sensor code required to communicate with my microcontroller and will start incorporating that code with my previous written attempts. There is some information currently on my site http://www.hapb.net/HAPB5.htm. The video at the bottom of the page is what you might be most interested in seeing.

One of many problems that is faced is that using open and/or closed loop PID processes is insufficient because you are always trying to catch-up with the changes. You need to incorporate a predictive algorithm such as a Kalman filter. One of the best, my opinion, microprocessors to use for this is the Propeller by Parallax because of its parallel processing power. Over the past 2 years a number of object files have already been written that anyone can use in their programs. They included 6 DOF (3-axis gyro/3-axis accelerometer) unit from Sparkfun, PID, Kalman filters, autopilot, and single/3-axis compass.

I would be happy to discuss in detail my progress and the problems I have faced if anyone is interested.

I'm working on an almost identical project next ear as my master's project for my engineering degree. A poor man's space telescope (nick-named 'Hobble'). We should compare notes some time, although I am not nearly as far along the line as you - the project doesn't start until September, although I think an objective for the summer will be to get something flying with yaw stabilisation.

I want to do night flights and try and get some shots of fairly wide things like Orion's belt, the band of the milky way and so on. There seem to be a lot of subsystems to be built, though, which is concerning me. Like a software developer, I think I'll have to be very strict on making it just do the job and suppress all my urges to engineer it to toss pancakes and do the washing up. As those guys say - 'YAGNI' - you ain't gonna need it.

I very much agree on the control - it has to be predictive. I haven't given much thought to it yet but Kalman is there as a baseline, although there are probably more robust techniques like H-infinity methods. The latter are appealing as I'm not sure how good a model I'll be able to get of the system dynamics.

I'm looking at guide-star augmentation for the control - magneto/mems to point it roughly in the right direction and then a guide-star tracker to (hopefully!) give pointing accuracy in the sub arc-minute range.

I think this is very possible with sparkfun-grade kit. We have good theoretical methods for getting the most from our relatively crappy sensors, and computing power is cheap.

The time is right for the garden-shed space telescope :)

Ed,

Sounds good. While my first series of tests are planned for solar tracking the idea was to be able to mount a celestial scope as well. I have been consulting with Texas A&M Spacecraft Technology Center for about 9 months now. They contacted me after running across my website and determined that I was working on something similar to their project. Collaboration is a good thing.

I also know the senior aerospace engineer at Aerostar. They make all the NASA balloons and parachutes, as well as the Macy's Parade balloon floats. Using latex balloons are fine for up and down but you have be able to float for longer durations if you want to get good results. They have already agreed to launch one of my payloads when I am ready. Of course, I have to do something for them in return, however, my point is that when it is time for your long duration test if you don't have the right balloon perhaps I can help.

I am planning to move away from HAM and start using ISM frequencies for tracking and telemetry as soon as I am able to get back on my project. Double layoffs in the family have forced me to put things aside until I found some work again. Hopefully I will be able to get back on track within the next month or 2.

Anyway, take care and whenever you want to chat please don't hesitate.

earl

From: Dan Bowen
Topic: 5279 Message: 5284

This would also be highly useful for high gain antenna pointing and
laser communications.

Thanks,
Dan

From: Dan Bowen
Topic: 5274 Message: 5285

Ralph, I have always enjoyed your work immensely, you have provided wonderful historical continuity to ballooning with your records, and a concise constant status of it's future. Your meticulous record keeping and adjudicating are one of the main things that I feel have made this a fun, competitive, and progressive hobby. By knowing what the rest of the groups had done before, we were able to become motivated to extend the envelope of amateur balloon capabilities, without wondering if we were just reinventing the wheel.

Will you be coming to GPSL this year, Ralph?

Thanks,
Dan

Hi Ralph,

Well, you've certainly done a great job keeping this growing community of balloonatics in touch with one another and what they do for, yea, these many years, and we all owe you a major debt of gratitude for all that hard work. You have left some pretty outsized shoes to fill!

Can't say that I blame you, however. I, too, have grown weary. For what it's worth, I've stuck with EOSS for way longer than any wage-yielding organization ever in my life - coming up on 20 years next January.

Tnx es 73 es GL OM!

Ralph...thanks for your tireless efforts in supporting and promoting ARHAB flights all these many years and maintaining the ARHAB website and records...it seems like yesterday when we first met after my first BalloonSat talk at the AMSAT conference ... I think in the late 80's or early 90's?

There will be a huge vacuum that would take all the helium in Texas to fill the void left by your absence with keeping the ARHAB site going. However, I do understand the Herculean task of keeping the ARHAB website current and I'm sure it's quite time-consuming what with the current level of ARHAB flights.

I would be happy to help continue the ARHAB website as long if some of our ARHAB web gurus could help code and design the ARHAB site to automate the announcements (with some moderator oversight to prevent SPAM)....I'd welcome any thoughts on how to implement this....as to Records page...we'll have to discuss best how to handle that as well.

If any of you can host the website on your server, I can point the domain name ARHAB.ORG to it in the future.

As to camera stabilization....Mark, I bought a handful of those IR sensors that were described in that article.....they are called Thermopiles....I will probably be flying them to see how well they work for payload stabilization in June or July. I got mine from Digikey:

Digikey Part No: MLX90247-ESF-DSA-ND

They will not work well in fog or rain... but for upper level balloon flights they should work quite well to establish a horizon reference.

5290. ARHAB Postings and Records and Ralph's Retirement

Yahoo group: GPSL (2009 — 2010)
Date: 2009-05-07 12:49:35 UTC
From: Keith Kaiser
Topic: 5290 Message: 5290

After a eMail conversation with Ralph, I had volunteered to take over his responsibilities. He suggested I post my interest to the list, he also proposed the idea of an ad-hoc committee to find his replacement. I think this might be a good idea for a number of reasons I'm sure most of you can think of too.

So I propose that all those of us who are affected by Ralph's decision put our heads together and decide how we want to proceed. We need a couple of people to step up and say they are interested in the job, and we need a couple more people to lead a discussion about the choices. Below is Ralph's estimate on the effort involved with this job, this should help some decide if they can manage it or not.

From Ralph,
---- quote ----
Regarding time and effort, ARHAB Launch Announcements started Aug04 from which we are approaching 5-years which approaches 260-weeks. During this period there have been 765 Launch Announcement editions which averages almost 3-editions per week. My MS Office-XP Word production process is very crude compared to state-of-the-art web-authoring.

Information comes in via several paths:

-- Direct E-mail
-- Balloon_Sked, GPSL, KNSP, et al, list postings.
-- Individual group list postings (I subscribe to every list I know about)
-- Monitoring web pages
-- Occasional nagging for information

Some part of all this happens daily. Thinking about my process, a few hours a week seems a
reasonable estimate.

Maintaining ARHAB Records is a very different animal. There are comparatively few updates but each
requires investigative work. I have been accepting entries below our top-10 with little argument;
have been more demanding for entries approaching our top-10; and much much more demanding for
entries near the top of each competitive category.
---- end quote ----

First lets find a couple of people who are willing to be the committee and make the final decision, maybe Ralph would like to be one of them. As I am interested in the job itself, I'll not volunteer for this

position, but others should. I think the final decision should be made no later than GPSL, July 17-19.

Should this be a two person job?

This definitely sounds like a multiple person job. Ralph, my hats off to you for making it work for so many years. There's not a lot I can do now with my job and going to school. And things will just get worse as GPSL approaches (by the way, thanks everyone for being willing to help move helium/hydrogen).

I'm not sure hosting is an issue but in case it is I've checked with
Troy Campbell he has agreed to host the sites necessary. As you know
he already hosts a number of sites for the ballooning community,
including the GPSL 2009 and before that 2008 sites.

But it's good to know others can do this part as well... so thank you
Joe.

5295. / camera stabilization/aiming

Yahoo group: GPSL (2009 — 2010)
Date: 2009-05-07 15:18:53 UTC
From: K. Mark Caviezel
Topic: 5295 Message: 5295

Mark:
You'll likely be able to dramatically improve the quality of the photography by going to a much more stable balloon platform. My first choice would be an air-filled solar balloon. My 1700 cubic foot tetroons are over 100 pounds mass at launch (mass of the air inside the envelope is the majority of the vehicle mass), and a zero pressure floater would be my next recommendation. I have a collection of video shot from ZPs at float- it is a very very stable platform!

best regards,

- Mark Caviezel ng0x

Hi mark,

any links to the videos?

Joe

5297. solar balloon video and others... Re: / camera stabilization/aiming

Yahoo group: GPSL (2009 — 2010)
Date: 2009-05-08 14:27:21 UTC
From: K. Mark Caviezel
Topic: 5297 Message: 5297

Joe:
Sorry, I'm at a location rt now that blocks youtube.
But it's easy to see the video.
Get on youtube. Then search for my ID, kmcaviezel.
Voila, you'll see the solar balloon video offered as a choice. There is also a launch video from the ARHAB displacement record holding 126,000 cubic foot balloon launched back at GPSL 2003, and a view of an ARHAB-class cutdown system pressed into service to cut down a 400 pound payload in the shop.

best

- Mark

5298. Re: ARHAB Postings and Records and Ralph's Retirement

Topic: 5290 Message: 5298

There may be some opportunity for some automation in the updates and record keeping. As Ralph mentions, some of the modern methods of web site maintenance could reduce the effort. Some candidates for automation would be

- collecting launch information through a web page with automated posting (maybe after a manual review before posting)
- flight records maintenance
- collecting flight information through a web page

I would like to participate in these discussions if we find them valuable.

Is this a time to look at creating a ARHAB organization (ARHAB NA) to
combine everything we do?

Hi Paul,

The ARHAB organizations sounds like a good idea....could be a good topic of discussion at GPSL this year.

I think having a way to automatically enter in your launch data on a website form is a good way to keep workload for the Announcement Page moderator, who would probably have to review the announcement before it posts to prevent SPAM listings (if there is more than one of us with moderator status, then if one is away on a trip, the other (or others) can approve the listing in a timely manner)....same goes for the Records Page....one or more of us could form a Records panel review team to review the data.

Another less time-consuming way to prevent spam on an automated Launch Announcements page would be to have whoever wants to post an announcement to create a logon name with password on the site...which could require a moderator (or moderators) to approve the logon registration name on a one-time basis. That way, it would completely automate the announcement process for registered and approved people and the announcement could immediately post....of course, the moderator could always have the power to remove a questionable posting or eliminate a Spammer logon name that somehow manages to get approved. This is basically the way that Yahoogroups do their Forums.

Using a content management system (CMS) like Joomla provides for a lot of these sorts of things. The site administrators can approve user accounts, and users can post their own articles to some portions of the site (e.g., launch announcements, record submissions, etc). Some sort of form entry is probably needed to enforce the launch date/time entry info so that the software can place the entries in time order. The entries could be placed in a table like Ralph's page, plus appear on a calendar (sort of like MS Outlook's calendar).

Administrators can exert more control over other portions of the site if desired (general ARHAB info, etc). I have not used a lot of the Joomla features yet, but there are a lot of community-contributed software addons which would make the site consistent and nice-looking and still provide for secure user-edited contributions.

5303. RE: [GPSL] Re: ARHAB Postings and Records and Ralph's Retirement

Yahoo group: GPSL (2009 — 2010)
Date: 2009-05-13 07:45:23 UTC
From: Rick von Glahn
Topic: 5290 Message: 5303

I've been poking around www.squarespace.com for a while It is amazingly simple to customize a CMS driven website. I'm forever stuck in the '90s with FrontPage over at the EOSS website. It's so big it will be a super pain to move someday but I keep peeking at new stuff. Squarespace seems pretty spiffy. The main problem, they host. You can't buy SquareSpace as you would with Joomla, Wordpress, Drupal and run it on your own machine. This offers advantages and disadvantages. Something we don't have to worry about, they can actively scale the site under heavy loads to serve a really big bump in crowds. Kind of like how you can clone virtual machines at Amazon and spread out your bandwidth exposure to multiple machines to handle heavy loading. But on Amazon you would have to handle that manually, Square space apparently can handle stuff like that in realtime. This is nice if you get "Dugg" or Slashdotted or something along those lines.

Anyway, it is the rage for its wysiwyg design metaphore. You can assign multiple "sysops", handy if you want to kick someone out. No global password except for the true site boss. They offer a 15 day free trial. But if you like it you will have to pony up between $14 to $30 per month. The expense is probably a killer since we have offers of free hosting but, the capabilities are really nice.

Just something for possible webmasters of this project to contemplate.

5304. ARHAB Balloon Dinner Saturday night at the Dayton Hamvention

Yahoo group: GPSL (2009 — 2010)
Date: 2009-05-13 17:14:59 UTC
From: wb8elk@aol.com
Topic: 5304 Message: 5304

We will be meeting Saturday night May 16th after the Hamvention starting around 6:30 pm at the following restaurant:

Good Asian Buffet
6999 Miller Lane
Dayton, OH 45414

(937) 898-1888□

It might also be named: Asian Buffet and Grill

This is just west of I-75 and just south of I-70 on Miller Lane (just south of Dog Leg road) where there is quite a restaurant row.

We may have the capability of showing photos and powerpoint presentations if we can get access to a private room...so bring along some photos or info to share if you'd like.

Some time ago there was a posting with a link to a web site showing the construction of a balloon tether release using modified plumbing parts on one of these balloon Yahoo groups. As I recall the web site was not in English (French, IIRC) and I'm having no luck now finding that link or web site.

Can anyone help? Is my description clear enough?

IIRC, it was from one of the balloon groups in Ontario, Canada. Might check Ralph's web site to find it.

I have a few thoughts and questions when it comes to UAV's

It is quite amazing the mindset of the FAA when it comes to UAV operations. There is something desperately wrong here. I fully understand the need for air safety. And have absolutely no problems with that of course. But what I fail to see the logic is the more or less total BAN on amateur UAV development. Or should I say High Altitude UAV development. I guess if you stay below 400 feet you are Ok. But this is the part I do not understand.

Someone can launch, and do all the time already totally legally by the way with the blessings of the FAA. Hundreds happen every day with yet a to be known incident. We are looking here litterally thousands of flights a year. Balloons that carry payloads up to 6 pounds each, and up to 12 pounds if multiple payloads. And use balloons that are anywhere from only a pound or two to balloons that weigh hundreds of pounds even!

Anyone can do this, and as I stated already do legally.

But to do a UAV at altitudes that the balloons reach up to 120,000 feet someone can not do. Of course above 60,000 is un controlled airspace. And you should be able to do anything you want. But you need to travel through 0 to 60,000 first.

But the part the FAA has NOT given is an explanation to is this. two examples,

Example 1

Someone fly's a 4 pound experimental payload via a balloon, It rises at a speed of anywhere between 500 to 1500 feet per minute, exactly how fast the rise is, is not too controllable, all depends on the lift placed in the balloon. The flight path is totally determined by the winds aloft. Whatever way the wind is blowing is the direction the balloon will go they have absolutely no control over this. The balloon reaches max altitude, and either pops or is terminated, (depends on the type of the balloon) and the payload starts to come down via a parachute. again totally un controllable, where it falls is totally dependent of fall rate and the winds aloft again. eventually landing wherever it lands,,

This is ABSOLUTELY LEGAL

Example 2

Using the EXACT same guidelines as the example for payload weight , weight densities, etc, it falls easily into the legal definition of the

above balloon flight in every way. But with one change, After separation from the balloon we someone is able to steer the payload. Be it a standard payload with a parafoil type of parachute where they can steer it to directions they want. Or taking it one step further a true UAV glider where it still meets all the spec's needed to be legal,as in a un manned free balloon payload type of flight, but now is in the shape of the airplane glider. So again it's steerable!

This Example is absolutely ILLEGAL and FORBIDDEN!!!

Why?

Ok we are thinking of safety,, which would you rather have,

1- a 4 pound box falling via a parachute to wherever it falls no matter where it is..and they do! I have Known of them land on tollways,, I have known of them land between taxi ways at OHARE international airport, Even at a Nuke plant where they called out the bomb squads to check it out. But this is all fine and OK and no one has a problem with it BUT.....

2- take a 4 pound glider, and as it's coming down if it looks like it might be going somewhere not safe,, an airport, or major approach or departure lane,, or any other not too safe situation so you decide to steer it so it does NOT go there. Sounds great huh? But IN THE FAA'S EYES THIS IS TOTALLY ILLEGAL.

Can anyone at all see any logic in this?

Maybe I see we haul the glider up to 100 K drop it, fly it wherever we wish until it gets to 60 K then let go of the controls, and let it go wherever it does, then once it's below 400 feet then control it again and land it he he he

Drop me a note with a copy of what you reply to this please. send it to,

nss@...

The total logic just escapes me.

Hi Joe,

You're correct re the UAV regs vs FAR-101. It appears that the folks who developed the UAV regs were totally unaware of the "other" unmanned aircraft regulation, which carries the force of federal law, rather than being an agency policy.

It's not as though I failed to point that out to them during the NPRM comment period, however. Where was YOUR voice back then?

I think the easy way to distinguish UAVs from Part 101 aircraft would be whether there's powered flight or not. There may have to be some exemption for model rockets, however.

Thanks for digging that up. It's not real clear how that gizmo works, but it seems that depends on the weight of the long end of the piano wire to complete the separation, but that happens only after the two brass pieces are pushed together - not sure how that happens during a burst but not before launch.

Hi Mike,

This time around I thought a bit about the mechanism and the dynamics and my best guess is that the weight of the piano wire is indeed pivotal (no pun intended) to the unlocking movement exactly as you've said.

Moreover, I believe the video is perhaps a bit misleading in that the small push motion is not needed in the actual situation, but what *is* required is simply the *untensioning* of the line together with the weight of what the inventor refers to as the piano wire tail:

"The tail of the pin must be folded up, as this acts as excess weight and switch to unlock the pin assembly." [Google translation from the French]

I think it was too tempting (in the making of the demo video) to use the small upward push to *force* the rotation of the locking pin for the purposes of the video, rather than the true situation of there merely being a release of the line tension occuring together with the pin tail swinging down "of its own accord" (by gravity).

So the video illustrates the pin tail being forced to rotate down (clockwise) by the action of the inclined cut in the brass part which in turn depends on an upward push of the lower coupler brass part, when in fact the desired action is the reverse where the pin tail rotation is the *initiating* movement, not a *resulting* movement.

Hank

5316. NASA balloon spotted over AZ/NM

UFO Reported in Arizona, New Mexico

Tuesday , May 19, 2009

PHOENIX —
NASA officials say it wasn't an alien spacecraft people in Arizona and New Mexico spotted floating far above them in the clear blue sky, just a giant research balloon.

Federal Aviation Administration spokesman Ian Gregor says he got calls about the object all afternoon Monday.

Bill Stepp of NASA's Columbia Scientific Balloon Facility in Palestine, Texas, says the mysterious flying orb was a 4,000-pound NASA research balloon used to measure gamma ray emissions.

Stepp says the balloon usually floats at 130,000 feet and can be seen for about 170 miles on a clear day.

Jennifer McCoy, who runs a UFO-themed Store in Sedona with her husband, says it "looked like the gigantic bubble from the Wizard of Oz."

Hi Nick,

Au contraire, mon frere,

At the start of the video, he demos how tension on the line keeps the parts together, and they stay together after tension is released. The locking wire only rotates CW to open the joint AFTER the brass pieces are pushed together. I guess one would have to dupe one of those assemblies to find out for sure. I was at A&A TP (now Ace H/W) today - shoulda looked for those adaptors.

It's also interesting to see the skinny line that they use - gotta be 50# tensile max - and the 1 ohm 1/2W resistor that they use as a cutter. Sure wouldn't survive a Hail Mary launch, even with an exempt payload.

Nicely done, Paul. Nicely done!

Recommend you get get a better vacuum guage, however. The Honeywell
15 psia conditioned transducer and a 200.0 mV DPM make a pretty handy
test instrument, and my wife Diann uses the DPM direct input to read the
Type K thermocouple voltage when she's firing her pottery kiln.

5328. UV Source

Yahoo group: GPSL (2009 — 2010)
Date: 2009-05-28 01:47:35 UTC
From: L. Paul Verhage
Topic: 5328 Message: 5328

I was at Walmart this afternoon looking for cheap robot motors (I'm looking at electric toothbrushes right now) when I came across toothbrush sanitizers. The one made by DenTek is less than $10 and it's designed not to operate while the case is open. They warn against looking at the UV. It claims to kill 99% of germs in 10 minutes.

At that price, I think I have the UV source for my environmental test chamber.

I recommend we meet at the Pizza Shoppe across the street from Garmin at 11 AM. It's on the southwest corner of 151st st. and Ridgeview. After lunch we can drive across the street to the Garmin parking lot in fewer cars.

Be careful at the 151st st. exit on K-7. It's also where you get onto I-35.

There's a mall (The Great Mall of the Great Plains) on 151st west of Garmin. If you're bringing someone who doesn't want to go on the tour, they could drive to the mall.

Hi Paul,

Two minor corrections to your doc for EOSS.

- We'll have 14 in the tech session.

- We'll have 19 on the Garmin tour.

We'll have one presentation for the group as your doc indicates. The helium request is correct.

Hi again Paul,

The ultimate in absolute pressure sensors would be a mercury barometer, but given the hazmat status of Hg, I've had no luck finding one at a reasonable price, or even pure Hg to fill a homebrewed one.

I do have a Stokes guage that covers 0-50 Torr absolute, and one of our guys has a 10" 2-turn Wallace & Tiernan 0-15 psia guage that's good to +/- 2 Torr over the full range. Something like that would be necessary to calibrate out the 1% FS errors in the Honeywell transducers - noting that we regularly encounter absolute pressures less than 1% of 15 psia.

The UV source in an EPROM eraser (which flash EEPROMS have obsoleted) or a replacement UV lamp used in some clothes dryers may also work pretty well. I picked up one of the latter lamps for a few bucks some time ago to make my own EPROM eraser. I think these lamps emit on the Hg lines.

Hi John,

The EOSS 18" x 18" x 18" chamber is made from 1/2" acrylic sheet stock with epoxied mortise joints. The lid seal is common closed cell 1" wide x 1/4" thick foam rubber weather strip. The walls do visibly deform a bit at 1 Torr absolute, but no implosions (yet!).

Tapped holes can be made for pipe fittings, etc., using a very slow drill speed with liberal 70% rubbing alcohol as a coolant.

It's nice to be able to see your experiment from all sides!

I opened it up last night. It has a circuit to boost the 3V to something high enough for the Hg lamp. The switch will be easy to replace with something more remote. Online they claim the selling price is $19, but I got it for $9.

Paul

5340. Launch Date

Yahoo group: GPSL (2009 — 2010)
Date: 2009-05-28 12:32:32 UTC
From: Jeff Dailey
Topic: 5102 Message: 5340

Taylor University will launch 12 balloons on june 1 at 4:00pm.

Universities from across the United States will attend a high-altitude balloon workshop at Taylor University on June 1 and 2.

Universities
Alverno University, Milwaukee, Wis.
Biola University, Los Angeles, Calif.
Butler University, Indianapolis, Ind.
University of Dayton, Dayton, Ohio
University of Indianapolis, Indianapolis, Ind.
University of Kentucky, Lexington, Ky.
Loras College, Dubuque, Iowa
Murray State University, Murray, Ky.
University of Nebraska, Omaha, Neb.
Shepherd University, Shepherdstown, W.Va.
University of St. Francis, Fort Wayne, Ind.
Tabor College, Hillsboro, Kan.
Tufts University, Medford, Mass.
Western Michigan University, Kalamazoo, Mich.
Wilberforce University, Wilberforce, Ohio

Next week’s workshop is funded through a Course Curriculum and Lab Improvement (CCLI) Grant from the National Science Foundation (NSF). During the two-day event, professors from the visiting universities will learn of the program from Taylor personnel so they can implement one of their own on their home campuses. They will also build science experiments for launch on a high-altitude balloon.
The launch will occur between 4-5 p.m., Monday, June 1.

Flight#175 CCLI Team1 APRS 144.39 KB9ZNZ-1
Flight#176 CCLI Team2 APRS 144.39 KB9ZNZ-3
Fliht#177 CCLI Team3
Flight#178 CCLI Team4
Flight#179 CCLI Team5
Flight#180 CCLI Team6
Flight#181 CCLI Team7
Flight#182 CCLI Team8
Flight#183 CCLI Team9
Flight#184 CCLI Team10
Flight#185 CCLI Team11
Flight#186 CCLI Team12

A second workshop will be held in July.

5341. A crack at the altitude record

Yahoo group: GPSL (2009 — 2010)
Date: 2009-05-28 16:25:32 UTC
From: Ed Moore
Topic: 5341 Message: 5341

Hi All,

I'm emailing on behalf of Rob Harrison, who is currently packing up a box full of stuff madly and driving from his place in the north of England to me in Cambridge, England.

We just decided that we should have a crack at the altitude record with the 3kg Balloon and payload that he has. We're going to launch at about 1am BST (12:00 GMT/UTC) from Churchill College, Cambridge, where we have a notam for Cambridge University Spaceflight launches. The winds are really unusually low for us, so we can more or less go up as slow as we want.

As some of you might know, we're legally limited to 10mW over here, so no APRS. Instead, we'll get everyone we can find to point their 40cm rigs up at the sky and listen to our 50baud RTTY. Ralph has given Rob rather stringent qualification requirements ("The entire decoded telemetry file sent directly to me from at least three separate sources.") and it's a very small group of folks here, so we're pulling in favours to get people to stay up all night and keep the thing tuned in.

You can track in real-time online. We have our own APRS-like system, where a little script on end-user PCs grabs the sound-card modem log and sends it to a central server which puts it on a map. For this flight, it'll be available here:

spacenear.us/tracker

Actual chat from us during flight and in chase cars and from the others in the UKHAB scene will be on the #highaltitude channel on irc.freenode.net - questions or anything else should probably be directed there, as I'm not sure how much email time I'll get now.

Best regards, and I very much hope to see some of you there.

Ed

5343. Alaska BEAR 3 balloon reaches 86.394ft

Yahoo group: GPSL (2009 — 2010)
Date: 2009-05-28 19:14:19 UTC
From: powellite52
Topic: 5343 Message: 5343

BEAR 3 balloon was launched Tuesday evening May 26 @ 8:15 PM local time (UTC: May 27 @4:14) in a almost clear and wind-less sky when the upper winds died abruptly. After launch, we watched in awe as the balloon went vertically above us and stayed there for almost the entire upward flight. From our launch facility located at Poker Flats Rocket Range, you could look up and see both the balloon and the radar reflector even when it reached an altitude of 30,000 feet. BEAR 3 continued its almost perfect and vertical flight until 86,394 feet, burst and began its descent, finally drifting a bit to the northwest. Upon balloon burst, our pilot Myles (KL1NU), Neal (WL7NZ) and Dan (KL1JP) took flight in Myles plane to give chase and record the descent and touchdown. They chased the balloon for almost 30 minutes, spiraling around and downward, amazed at the beautiful sight of a fully deployed and perfectly descending parachute, observing and photographing the descent and touchdown. Plans are under way to organize a search and rescue team and recover the BEAR 3 unit from its remote location. We will be adding photographs, data and information for the next several days, including still pictures and movies from the on-board camera payload.

We are getting a 4 wheeler recovery team together. They should be heading out to pick up the balloon and data capsules tomorrow. Beside the on-board still camera and video gear, we've got a volcanic ash particulate sampler we hope captured ash from Mt. Redoubt's last eruption at above 30K.

For more information: http://www.bear.437am.com

cheers
Dan (KL1JP)

Yeah, at first glance, it looks as though it rises from the surface to the "edge of space" - much taller than anything man-made other than maybe a rocket plume. And it's fatter at the bottom than the top, just the opposite of the possible partially-inflated ZP in the other pix you linked to.

That just leaves a (yawn) UFO - oh, well ...

Reach For Space Flight #24

After repeated weeks of postponements we were able to launch from the K5IS/N5IS farm near Booker, TX,on Saturday May 30th. Flight time was 91 minutes for our 1200 gram balloon with 6.0 pounds of payload in three packages.. The 144.390 APRS failed at lift off. (Low battery voltage) thus WL7ii-11 did not provided any data during the flight. On the way home it did come alive and provide some useless position reports. The Find Me Spot provided three items on the way up and just one item on the way down. Our only winds were on the surface which had gusts over 20 mph at lift off. Balloon traveled just 12.27 miles to the ESE landing 2 miles west and 1 mile north of Darrouzett, TX. Estimated altitude may be between 76,000 and 80,000 feet. The parachute did not open properly and payloads hit the ground hard. The 28.322 MHz oscillator chip bounced out of its socket. During the flight this WL7ii beacon was copied in Cisco, TX, and Midland, TX, and
Colorado Springs, CO. The 433.40 (15 mw) and 28.748 (150 mw) K5TTU beacons survived the crash. The center conductor of the 144.390 coaxial dipole snapped off sometime before we recovered the payloads. Spot unit shifted within its case and the two button switches caught under the case edges, turning it off. It is very rare for us to have a flight of less than a 100 miles. Our flight camera failed to record any images. A more detailed report is posted on RSFHAB@yahoogroups.com. Jerome, K5IS@..., flight director.

From: BASE
Topic: 5351 Message: 5351

Dear all,

The weather forecast for the next 48 hours is fascinating. The current predictions for early Wednesday afternoon (local time of scheduled launch) have worsened with a 60% chance of thunderstorms. I know we could easily launch on Thursday morning, but that will put too much pressure on the high school students to complete their poster by Friday afternoon. I would love to be accessible to Ron, Justin, and Corey, but the students come first.

The forecast discussion tonight on the National Weather Service website supports the idea of flying on Tuesday (tomorrow) afternoon. To launch tomorrow afternoon, we'll have to work very efficiently in the morning, but I think we could leave Greencastle by 1 pm or so and launch a little after 2 pm (1800 UTC) from Eminence, Indiana. Landing would be about 40 miles to the ENE near I-74 between the southeast portion of Marion County and Shelbyville.

We will be flying two APRS units on 144.39 MHz, W1IX-11 on the even minutes and W9YJ-11 on the even minutes plus 45 seconds. The W1IX-11 is the all-in-one MicroTrak unit from Byonics. We hope to see if it works above 60 kft.

Our 2000 gram balloon was intercepted by the US military. We'll fly a 1500 gram balloon and probably will only reach the mid-90s of kft. To save some payload weight, we won't fly our light sensors.

Our tracking crew will be traveling in amateur radio silence (I'll get my license later this month!?). I'll try to update on Twitter during the flight. My cell phone is (765) 721-4179.

I'll update in the morning about our launch plans.

Thanks for being flexible.

Dang! Almost enough to make ya wanna take up a less exciting hobby,
like stamp collecting, eh?

For wot it's worth, EOSS has flown 139 times since 1990, and we've NEVER
experienced a "perfect" flight, and some the early ones weren't nearly as
tame as your #24.

Congrats on executing a recovery, despite all.

5353. Pressure Sensor and GPSL

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-02 13:37:46 UTC
From: L. Paul Verhage
Topic: 5353 Message: 5353

I got my sample sensor and see that they are what I expected. I'll bring some of them to GPSL. If you're interested in a $10.25 pressure sensor, you can pick it up there. They cost an extra $0.25 because of shipping.

I tried to contact Garmin to give them an up date, but Gretchen in HR is on vacation until Thursday.

I checked out the Far Point observatory for a launch site, but tsee there are too many fence. So I' trying to contact the school next door. I also have a lead for a launch site at an RC flighting club at Perry Lake. As another back up, we should be able to use the soccer fields at KU, but I need to fid out who I verify this with.

I'm visiting my school today to check up on the conference room. I also want to coordinate getting the campus alarm turned off we we can pick up the helium Saturday morning. It would look real suspicision if the Topeka police responded to an alarm and saw half a dozen cars loading tanks of gas.
Are there anymore updates in attendance?

Those of you that did GPSL in the past, what else should I be doing now?

5355. Re: [GPSL] Pressure Sensor and GPSL

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-02 14:07:49 UTC
From: L. Paul Verhage
Topic: 5353 Message: 5355

Pressure sensors that run from 15 to 0 PSI are at least $30. Most pressure sensors run over only a smaller range anyways. Several years ago I developed a near space weather station and since I am selling BalloonSat flight computer kits, I want to produce a weather station for them. Well, I found out the company has stopped making these particular sensors and has no plans to make any more. Fortunately, they have some left in stock, their last ones. I've arranged to test one of them to make sure they are what I expected and they said they'd sell them to me at a good price if I take them off their hands. It's going to cost me nearly $1,000, but these are pretty good sensors and I'll get them at a good price. I'll need a bunch for the waether station kits, but I'll have some extra left over. I offered to sell some at cost to help me purchase them. I got requests for about a dozen of them. So I'll bring them to GPSL so there's no cost involved in mailing them (I just need to charge part of what I'll be charged to have them shipped to Kansas).

Date: Monday, June 1, 2009, 8:28 PM

Dear all,

The weather forecast for the next 48 hours is fascinating. The current predictions for early Wednesday afternoon (local time of scheduled launch) have worsened with a 60% chance of thunderstorms. I know we could easily launch on Thursday morning, but that will put too much pressure on the high school students to complete their poster by Friday afternoon. I would love to be accessible to Ron, Justin, and Corey, but the students come first.

The forecast discussion tonight on the National Weather Service website supports the idea of flying on Tuesday (tomorrow) afternoon. To launch tomorrow afternoon, we'll have to work very efficiently in the morning, but I think we could leave Greencastle by 1 pm or so and launch a little after 2 pm (1800 UTC) from Eminence, Indiana. Landing would be about 40 miles to the ENE near I-74 between the southeast portion of Marion County and Shelbyville.

We will be flying two APRS units on 144.39 MHz, W1IX-11 on the even minutes and W9YJ-11 on the even minutes plus 45 seconds. The W1IX-11 is the all-in-one MicroTrak unit from Byonics. We hope to see if it works above 60 kft.

Our 2000 gram balloon was intercepted by the US military. We'll fly a 1500 gram balloon and probably will only reach the mid-90s of kft. To save some payload weight, we won't fly our light sensors.

Our tracking crew will be traveling in amateur radio silence (I'll get my license later this month!?). I'll try to update on Twitter during the flight. My cell phone is (765) 721-4179.

I'll update in the morning about our launch plans.

Thanks for being flexible.

Hi Paul,

What's the make & model of the pressure sensor? Do you have a spec sheet
you can attach or pass a link to?

WHEN A SOLDIER COMES HOME
This email is being circulated around the world - please keep it going

When a soldier comes home, he finds it hard....

..to listen to his son whine about being bored.

....to keep a straight face when people complain about potholes.

to be tolerant of people who complain about the hassle of getting ready for work.

...to be understanding when a co-worker complains about a bad night's sleep.

..to be silent when people pray to God for a new car.

...to control his panic when his wife tells him he needs to drive slower.

..to be compassionate when a businessman expresses a fear of flying.

....to keep from laughing when anxious parents say they're afraid to send their kids off to summer camp.

....to keep from ridiculing someone who complains about hot weather.

....to control his frustration when a colleague gripes about his coffee being cold.

....to remain calm when his daughter complains about having to walk the dog.

.....to be civil to people who complain about their jobs.

....to just walk away when someone says they only get two weeks of vacation a year.

....to be forgiving when someone says how hard it is to have a new baby in the house.

The only thing harder than being a Soldier..

Is loving one.

I was asked to pass this on and I will gladly do so,

Will you???

5360. BASE 36 flight summary

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-03 01:29:48 UTC
From: BASE
Topic: 5360 Message: 5360

Dear friends,

BASE 36 was a partial success. Launch at 1840 UTC from Eminence Indiana. Slightly more surface wind that expected resulted in a reduced ascent rate (You'd think I'd remember my own talk from GPSL last year). At 18 kft the ascent stopped and a gradual descent eventually began. We will check the timing on the flight path, but the balloon probably encountered some very heavy rain about that time.

Landing east of New Castle, Indiana at 2140 UTC. Since the balloon was still significantly inflated the payload string did a series of touch and goes across a recently planted corn and subsequent soybean field. The bottom payload, weighing 5 pounds, represented 60% of the total payload weight. I caught the bottom payload after about 90 bounces across the field.

Will do a post mortem on the balloon tomorrow to find the leak.

Since the students didn't get to enjoy a high altitude flight, we will fly again on Thursday morning.

W1IX-11 had an antenna failure either just before launch or just after release.

Details on BASE 37 will follow.

Howard

5361. BASE 37 for Thursday, June 4 14 UTC

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-03 01:49:29 UTC
From: BASE
Topic: 5361 Message: 5361

Dear all,

A Bonus Flight! BASE 37 will fly on Thursday, June 4 about 14 UTC (10 AM Eastern Daylight Time). Preliminary launch site at Cloverdale Indiana. Landing near Fairland, IN.

Flight will use 1200 gram balloon to carry Earth Sensor, Tilt Axis Sensor, and Geiger Counters up to approximately 100 kft.

W9YJ-11 on 144.39 MHz, every two minutes.

Primary tracking on 900 MHz spread spectrum.

Howard

Hi Howard,

Ergo the EOSS motto: "A little more gas"

Congrats on the recovery after the multiple landings. Our experience
with that kinda monkey-shines is with the bottom payload breaking free,
allowing the balloon to soar skyward again. We did one where the same balloon
executed three successive ascents and three landings - made for one looooonngg
day!

Here's the first launch site I've gotten approval for (attached image).
It's mission Valley high school west to Toeka. Here are its coordinates,
North 38 deg 53.163'
West 96 deg 00.040'. They have a very long parking lot. I'll vist an RC
club tomorrow evening about using their run way.

I've also attached a spreadsheet from a test I ran on the weather station in
my environmental chamber. Very odd that the RH and temperature both dropped
as the pressure did. I'm not sure why. Is the temperature sensor (a
LM335) being heated by the air around it (so that when it's in a vacuum, it
cools)?

I was quoted a price of $75 for a T tank of H2 and $102 for a T tank of He by Kirk Welding.

This is what I have for gas so far. It looks like Kir will switch out a nut and nipple from one of my helium fillers for the hydrogen versions for around $10.

Helium

NearSys - 1

Bill Brown - 1

NSTAR - 1

EOSS – 2

ARBONET - 2

U Minnesota – 3

ORB – 1

Cathcart - 1

Hydrogen

NSV- 1

From: L. Paul Verhage
Topic: 5365 Message: 5365

As of right now, the third NearSys flight is scheduled for this Saturday near the University of Minnesota, Twin Cities. My module will transmit as KD4STH-8 on 144.390 (packets at once per minute). I'll try to email the exact launch time.

I'm flying a new flight computer (the Near Space UltraLight) with a still digital, a video, geiger counter, and internal temperature sensor. The video is aimed down at the Idaho cluster bomb.

Also onboard is a BalloonSat Easy with a remote IR temperature sensor. It's aimed up at black sky and in an insulated tube.

5372. Re: [GPSL] BASE 36 flight summary

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-03 06:53:28 UTC
From: wb8elk@aol.com
Topic: 5360 Message: 5372

Hi Howard,

I did a flight in 2005 that later turned out to have a 1/4" hole in the balloon envelope (granted it had been sitting on the ceiling of our highbay for 3 weeks before we managed to retrieve it and fly it - the result of an "oops" moment during inflation).....it stopped ascending at 34,000 feet and came back intact...it actually took a bit of effort to get the thing to burst after we recovered the payloads and balloon....photos shown in the following web link...it may take a minute or two for the photos to load in as they are fairly large photos.

http://www.wb8elk.com/BalloonZero.htm
(http://www.wb8elk.com/BalloonZero.htm)

It was quite fun to watch the balloon descend leisurely right in front of us. As you may recall from last year's GPSL's presentation, when I intentionally put two 1/16" holes in the nozzle the balloon did nearly the same flight profile....one hole however got it to float all night long at 107,000 feet.

Your leak may not be in the balloon envelope itself...it could've been in the nozzle if it wasn't tied off tightly enough.

Hi Nick and all,

I had a chance to meet with Dimitru of the Romanian group mentioned in your email....in fact I had a blast talking with his group about balloon and rockoons until the wee hours....they are great folks who are doing quite innovative things with rockoons and balloons.

Here's a link taken at the roll-out of the Lunar Xprize at Google headquarters...you'll see a photo of me and Dimitru at the event (I'm a member of one of the Lunar X Prize teams called Lunatrex)....

http://www.wb8elk.com/googlevisit/ (http://www.wb8elk.com/googlevisit/)

The Lunatrex website: _www.lunatrex.org_ (http://www.lunatrex.org/) and _http://www.lunatrex.com/bios.htm_ (http://www.lunatrex.com/bios.htm)

I must say that Google is quite a fun place to work from the looks of it....there are many restaurants on their "campus" all free of charge to the employees....free garden, tons of other free stuff and a relaxed work atmosphere similar to that of a college campus. I didn't see a suit or tie in the whole building (except for those of us in the X Prize teams)....I was sitting next to two fellows who were wearing T-shirts, jeans and tennis shoes at the press event...I assumed that they were college students and asked what college they were from....they replied..."Google University", we own this place....they turned out to be Sergey Brin and Larry Paige, the folks who started Google.

5377. BASE 37 essentially completed

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-05 01:00:49 UTC
From: BASE
Topic: 5377 Message: 5377

Dear friends,

BASE 37 was a successful flight with a hanging ending. Launch was at 1422 UTC from the Cloverdale Middle School in Cloverdale, Indiana. We had an attentive group of about 50 Middle Schoolers to watch the launch. The flight followed the predicted flight path, with burst at 95000 feet at1611 UTC. Landing was just south of the Hancock-Shelby County line at 1734 UTC. The lat/long are 39 d 40 min 48 sec N and 85 deg 51 min 0 sec west. The final 500 feet of the descent was observed by our Cloverdale High School students. Despite the abundance of surrounding farmland, the payload boxes are near the top of a 100 foot ash tree. Surrounding trees prevented the successful use of the EZHang retrieval system.

As of 0 UTC 5 June, the W9YJ-11 beacon is still hitting the digipeater. Recovery of the payloads will be accomplished on Saturday afternoon with the assistance of a friendly property owner.

Thanks for your support,
Howard

Hi

Purely due to the increasing cost of Helium, we're investigating using Hydrogen on some future flights. I'm curious to know other groups experiences with Hydrogen. Please weigh in on the following questions: (Sorry, that was a really poor pun)

Are we crazy?
Do I, as my wife suggests, just have a death wish?
What precautions do you take to reduce the risk of ignition? I realize that you need a certain amount of oxygen to reach ignition, but let's assume there's enough air accidentally in the balloon when you start filling.
Anything else?

Thanks

Bruce - VE5BNC

5380. Minnesota Mission

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-07 20:52:49 UTC
From: L. Paul Verhage
Topic: 5380 Message: 5380

The mission with the Minnesota spacegrant went well. That gave me another state I've launched from and a new state I've recovered in. The 1200 g balloon made 89,095 feet according to my new flight computer. We had a problem when apssing under the antenna null on chase, the first time I can remember that happening. Recoverery was about an hour
inside Wisconsin. The near spacecraft set down on the canopy of old growth forest (t was just a narrow band of trees, but we hit it good). It took 90 minutes to cut down the two trees with a hand saw. Perhaps a chainsaw should be considered standard recovery gear. I'll get video and light data up on my website this week.

5382. WB8ELK Ozone Hitchiker recovery amid the snakes

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-08 08:24:04 UTC
From: wb8elk@aol.com
Topic: 5382 Message: 5382

Had a nice visual sighting and saw the balloon burst with a pair of binoculars.....could see the red parachute at times at 105,000 feet.

Recovered about 500 feet south of the Tennessee River across the river from the Redstone Arsenal in Huntsville... lat: 34deg 34.56 min lon: 086 deg 36.23 min

Website with photos of the launch and recovery:

http://www.wb8elk.com/oz060609.htm (http://www.wb8elk.com/oz060609.htm)

I could hear the CW telemetry from about 2 miles away and was able to copy the final lat/lon coordinates which led me to a field next to a snake-infested swamp (thanks to Gary Dion N4TXI for talking me into the closest drivable approach)....the landowner saw me at the private gate (turned out to be Tony Moore, the owner of the Decatur Tony Moore auto dealership and he allowed me to hike into the area....it was a hot day and he gave me a cold beer before I set out my long hike (not sure if it was because it was hot, or to deaden the pain if I got bit by one of the poisonous snakes in the snake-infested swamps that surrounded the area). About a half mile hike down a trail and I could see the payloads laying out in plain site in a freshly mowed field (but on the other side of a swampy area). It took about a quarter mile detour to get around the swamp worrying all the time about the numerous snake tracks and burrows as I slogged along in the reeds and muck... but I finally got to the payloads laying neatly in the mowed grass.

After getting back to the trail I breathed a sigh of relief that I was now free of the Water Moccasins, the Copperheads and the Rattlers.....just then a 6-foot long snake zoomed across my path nearly running over my shoes....fortunately he was running away from me and not towards me.....I never knew snakes could move so fast.

The parachute was completely fouled up and tangled with the balloon remnants and the chute was even split up the middle....that explained the 17 minute descent (approaching free-fall speeds).

This was the final test of my mini-tracker multi-mode beacon transmitter....Of all the modes I comparison-tested on this flight (RTTY, CW, Hellscreiber, DominoEX11 and DominoEX16), I found that the best all-round mode that even handled the rapid fading of the balloon's rapid descent was the DominoEX modes....winning by a large margin over the other modes. This time I audio modulated the DominoEX tones in FM mode.

I'll be flying it again on 144.34 MHz from Indiana this coming Friday around 11 am EDT from Columbus, IN (Bakalar airfield) as part of the SpacePort Indiana's SpacePort Camp activities.

This flight will just be DominoEX11 in FM mode and CW in SSB mode at a once a minute update rate.....there are two programs I recommend that are both free to download to copy the DominoEX modes: MultiPSK or FLdigi....DM780 under Ham Radio Deluxe will also work, but only when I'm flying the DominoEX8 or 16 modes...for some reason they don't do the default DominoEX mode of 11 baud.

Okay, that would have been a little tough for a chase.
:)

Well, I suppose I need to look at adding Wisconsin to my states I've
launched from. It probably won't be until next summer, but perhaps we could
get together for a launch.

5386. Launched All States

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-08 16:00:36 UTC
From: L. Paul Verhage
Topic: 2569 Message: 5386

EOSS, I realized Nebraska wasn't listed as a state you've launch from (GPSL 2005), so I added it.

When anyone gets a chance, could you look under http://nearsys.com/arhab/states.htm and see if I need to add something for you?

Keith,

Good catch!

Paul,

EOSS will take credit for Nebraska for GPSL 2007 in Grand Island and for last year□s GPSL in Liberty, Missouri. We□re already credited with Iowa, probably for the 2005 launch Keith mentioned.

73,

Nick

NØLP

EOSS GPSL Coordinator

5391. Re: [GPSL] Minnesota Mission

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-08 16:41:16 UTC
From: L. Paul Verhage
Topic: 5380 Message: 5391

I just flew my 72nd flight and in my 10th state. I hope to get North Dakota this summer.

I'll bring a capsule and share a ride with you, we can split the cost. I'll have a tracking capsule with a flight ocmputer that will record data from experiments.

I've uploaded data from my last flight, so look at nearsys.com under 2009C flight results. The two things to look at are the cosmic rays counts and the IR experiment.

The cosmic ray flux began to increase above 81,000 feet - I've never seen that before. I don't think the flight was that much closer to the geomagnetic north pole, but it's something I want to investigate. So I would definitely like to send another Geiger counter up and try to make a higher altitude from a northly launch site.

The IR experiment is a IR thermometer that you point at an object to get its temp. This one is the 90 degree field of view sensor from Parallax. It's inside of two insulated styrofoam tubes and aimed at a 45 degree angle so it can't see the balloon or the sun. Next to it is a LM335 temp sensor. Now it doesn't make sense that the LM335 felt a temp of 100 degrees since it was 50 degrees at launch (so I'll run a test on it). But it is gratifying to see the sensed temp of the sky dropped faster that the temp of the instrument. I'll go home and update the webpage with an mage of the instrument. It's small mysteries like this that make near space so much fun.

Onwards and Upwards,
Paul

On a flight in 2000, we saw an increase in radiation at
~80k as well:

http://balloons.space.edu/habp/project_10/

Turned out a solar flare had erupted the day before.

Hi Paul,

I added Missouri at GPSL last year....so that now makes 20 states.

Looking forward to seeing you all at GPSL 2009.

I recall that. But we're quiet now, so I really need to launch this again
to see what is going on.

Sigh, a near space explorer's work is never done.

Harry, did you launch last year at GPSL? I don't have you listed for
Missouri in the Lanched All Stats page.

Okay, I've added Missouri to the list of states for ORB. I'll update the webpage shortly.

Are you planning a launch for the September/October time frame? I'd like to add Oklahoma to my list of states I've launched from.

OSU and I had planned to fly a dual flight sometime this year. It could be this fall. I'll let you know if we do. If we don't, maybe you and I can work something else out.

From: L. Paul Verhage
Topic: 4427 Message: 5400

Right now it looks like lunch and snacks will run $15 per person.

I'll be contacting Royal Valley HS about using their school as a launch site
next week when the principal gets back. The RC air strip didn't work out.
I'm putting the schedule together now, so expect that by tomorrow.

5401. 50 Ohm Antenna

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-11 04:00:38 UTC
From: L. Paul Verhage
Topic: 5401 Message: 5401

I'm looking at the datasheet of the radio I'm using in my flight computers and see it has an impedance of 50 ohms. The SMA connector I want to use fits a 50 ohm RG174 perfectly. I like dipole antennas, but see their impedance should be 73 ohms. If I was reasonably accurate with th online SWR program I used, then SWR beween a 50 ohm coax and a 73 ohm antenna is not much greater than 1.0. So it sounds like the radio and antenna should work well.

But after a little more reading, I see the Inverted Vee antenna is closer to 50 ohms and it has a smaller null (it's more isotropic). So it seems a better match is is easy to make (just bend the antenna elements to a 90 deg angle).
I'm wondering if my loss from adding a 73 ohm dipole to a 50 ohm coax and radio is worth the effort to create an inverted vee antenna.

Any thoughts? Is a dipole close enough? We did see a null in my flight computer last weekend as we drove beneath it, the first time I remember seeing this.

Paul,

Id run some modeling for you if you need it, but I thought of this several years ago also, and from what the modeling showed was very disturbing.

The pattern if you assume all polarities looks good, and as you thought very close to isotropic. really!

but when you add the factor of a linerally polarize antenna for receive, then it's horrid! easily 50% of your power is being radiated in polarities you cant use. plus at angles you don't want either. modeling it looks terrible for a balloon antenna.

Personally if i were you i'd go with a inverted ground plane,

Sloping the radials close to a 45Deg gives ya the 50 ohms you want, flat ground plane 36 ohms, straight ground plane (dipole 75 ohms, and a ground plane with sloping radials 50, change angle to make best match.

Plus its truly omni, and only vertically polarized, all the power is going into one polarity.

Yes there is a null still but it's directly under the payload. where the free space loss is the least anyway,.

Now,,,, if you really want to get creative,,, The best video we ever got was using a Horizontally polarized antenna like a turnstyle or OAL's wheels, BUT

spaced under a reflector at 0.54 wave below the reflector. This was awesome!!

it gave a omni downward tilting main lobe with a downward tilt of about 20 degrees. AND a downward lobe that is about straight down that is about 10 db below the main out to the horizon lobe. so pretty balanced for free space losses. This antenna gave us the best images both on the horizon as well as for the chase teams directly below the payloads.

From: Mike Manes
Topic: 5401 Message: 5404

Hi Paul,

A simple vertical dipole fed with 50-ohms oughta work just fine, presenting less than 1.5:1 VSWR. You probably wouldn't want to run the dipole or inverted V in a horizontal orientation, since you'd get a lot a spin fading as the nulls of each end point your direction. But if you make your dipole vertical, you'll have to mount it right on your payload to keep the coax shield from messing up the pattern and impedance, and that will drive a lot of RF into the payload guts.

We've had great luck with a flexible J-pole, modeled after the MFJ "pocket rollup", which has the same pattern as a vertical dipole, but since it's end-fed, isn't bothered by the feedline. Since the radiator is an end-fed half-wave that has a real high feed impedance, the counterpoise current is minimal, so not much creeps back up the outside of the coax to make mischief inside the payload.

If you strap it to your payload support line with generous slack in the copper, it'll last a long time over many flights, especially if you replace the RG-58 with RG-142.

Oh, one other thing re the null when driving under the payload: if you're using a vertical on your mobile, you're putting two antenna nulls end to end. Remove one of 'em by moving your mag mount to the side of the car so the mobile whip is more horizontal. Works well.

Paul,

I have used dipoles on every flight for APRS and beacon. They are directly attached to the capsule with RG-174 running through the side. They have performed very well. I cut the dipoles a little long then tune them after they are attached. I've had all but a 1/2" of the hot and gnd radial tore off from post-burst trauma and still got enough of a signal to recover the payloads with my 1/4 wave mobile antenna.

My preferred solution to this problem: Drive to where the balloon is going to land, not underneath it during the flight.

BTW - To cover the hot radial I use plastic tubing that is intended for RC car antennas. It comes in 3' lengths and can be found at your local hobby shop. It gives the radial rigidity. I just leave the gnd radial hang free.

So what I'm reading, there's no reason not to use a dipole on a 50 ohm radio, the SWR is low enough. The other designs are nice, but I like the dipole's simplicity.

I normally use a dipole and have build a PCB to make it more durable.

Agreed. Our trackers deploy to the predicted landing site before launch. But, on some of our summer flights, the balloons have picked up the strong upper easterlies and have flown right smack over the ground station at the launch site. In those cases, we've just switched over to a mag mount stuck to a vertical surface. Simple fix. And Joe's observation that range loss is fairly low compared to 100 miles downrange is right on.

Plus, I would think a dipole that close to the payload will be de tuned
by the Box if shielded like ours always are, a dipole in full contact
with foil I bet has a horrid SWR.

Or if a bare box then still all the rest of the wiring in the box and
or componenents so close must also de tune it too as well as make it
FAR from omnidirectiioal

Like I said, tune them after they are mounted. Never have had a problem irradiating anything in the box either. One nice little benefit on an Xband repeater flight though... even though the Xband HT was in a capsule 8 ft below, every time the xband was keyed up the 12mw CW bcn ID was heard very faintly on the Xband carrier providing an unexpected ID for the Xband. ;)

The school in Hoyt is a little tight for space, so I've contacted the city park. It will be our backup launch site.

I've attached my GPSL plans. New this time is the tentative schedule. Please look it over and make comments.

Also see if I missed adding attendees.

Keith, what do we have to do to have the movie at KATS? Will it be sent to us? also, do you know how we take care of the cost?

Mark, can you monitor the weather and make predictions at GPSL?

Thanks everyone,

The pressure sensors have arrived. There were about a dozen of them spoken for, but I can't find those emails. If you're interested on one, please let me know. The cost is $10.10 and I'll have them available for pick up at GPSL.

The rest of them are for the weather station kit I'm producing, so I can only let those first dozen go.

My website, under catalog, will have the datasheets.

The packets indicate that the flight is from the University of Minnesota and the Minnesota Space Grant program. One beacon is the primary, and the other the secondary. With the time slotting, there are altitude differences, but it appears that both are on the same flight string.

From: Mike Manes
Topic: 5424 Message: 5424

Historically, the greatest risk of H2 ignition in ballooning is
static discharge. It takes 100 x less energy to ignite an H2-air
mixture than a methane-air mixture.

And 100% H2 won't burn, but the stoichiometric range is like 14% to 75% -
much broader than other gaseous fuels.

Re purging the fill line with H2: when you crack the valve on an H2
bottle, expect a "pop" and maybe even a sustained flame. It seems the
intense vortex created by a slightly cracked valve can produce bubbles
of very high temperature at their cores. So better to purge with N2 or
CO2, although if that "pop" is constrained to a tube, then it'll be
pretty well contained and won't propagate far, since it consumes the
available O2.

Hi Joe,

You've got the luxury of filling inside a barn, out of the wind. EOSS has to operate from open fields with AC power and latrine access, well clear of Denver's Class B airspace, and a 3000 gm balloon is about 18 ft tall when filled to 30+ lb neck lift - that's one tall barn! So we get it over with fast - with no regulator, which has frozen up on us a couple of times - just straight into a manifold and a 1/2" rubber hose to the fill rig - in under 15 minutes. We can get two flights off 20 minutes apart. See:

http://www.eoss.org/ansrecap/ar_131/recap140_141.htm

We're seriously considering going to H2, but right now, Colo Space Grant says they're willing to wait for He to get a lot more pricey for their flights. We may do some self-sponsored flights in H2 in the near future, however.

yeah i'll agree on that. For 90% of the flights we have done mostly
indoor inflates. so yeah got me there.. we have done a few outside
fills but then they wer dead calm too like with the giant PE balloon.

Sure wish this reflector didn't force a "Reply To"!

We start our full pretty slowly to avoid "luffing" the latex. But as the balloon fills out and lifts, we crank it up pretty hot. Gets REAL noisy! The manifold lets us tie into 3 bottles at once, which makes switching bottles quick and easy - it takes about 2.5 T-bottles to fill a 3000 to 30 lb neck lift. When the 1st bottle empties, just shut its valve and open the 2nd one, etc.

5428. Fwd: Frequency coordination for GPSL

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-15 15:25:52 UTC
From: L. Paul Verhage
Topic: 5428 Message: 5428

Yes!!

I need to ask about frequencies in the KC area, since we should be headed generally in that direction.

It seems that the launches I've done so far from KU, that 144.390 was open. Keith, and anyone else familar with the KC area, is that true? I'm stuck on 144.390 for some of my trakers. Is that the case for others?

I'm going to recommend 144.390 be the standard and that we time slot. Does anyone else plan to use something different like 144.36?

Let me know what frequency you'd like to use and a time slot. I'll add that to a new page and email the result back to the list for deconfliction.

Paul,

It's probably about time to gather up frequency requests so we don't have a bunch of last-minute shuffling to do.

Paul,

We might want to use 144.990 it is gated and has less traffic.

NSTAR would like to use 144.36 (primary) and 144.39 (secondary). 144.39 would be a single TX once per minute. Both are flexible though.

5432. Amazing balloon burst video from the June 12th Spaceport Indiana launch

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-15 17:17:25 UTC
From: wb8elk@aol.com
Topic: 5432 Message: 5432

I put the Flip Ultra digital camcorder unit on this pointing up at the balloon for our Spaceport Camp student flight. We had video cameras pointing up, down and at the horizon as well as Canon still cameras. In the past, I've used the RCA SmallWonder units but they tend to freeze up after about 25,000 feet unless you have them in a heated environment....the most I've been able to get out of them was about 60 minutes worth. So I went in search of a better camcorder and found the Flip Ultra on sale for $129. It has 4 Gb of internal memory and claimed 120 minutes of record time....although there is no room for expansion, the plus is that it runs on 2 AA batteries.

It worked flawlessly in a tough environment (pointing up at the balloon with the lens explosed to the elements and no other heat sources)....recording the entire 120 minutes with life to spare on the 2 AA lithium batteries....the quality of the video is amazing and the stereo sounds makes it feel like you are going along for the ride...even with the YouTube compression I think you'll see the video and audio quality of this camera. I plan to fly a couple of these at GPSL this July.

The payload you see above the camera are the Eggsperiments with Peeponauts inside (and an earthworm and roly poly bugs - they didn't survive)...also two small snack-sized potato chip bags are on either side of it....they did not pop but puffed out like pillows...the potato chip bags both flew off on the descent at about 45,000 feet.

http://www.spaceportindiana.com (http://www.spaceportindiana.com)

YouTube of the burst at nearly 95,000 feet:

From: w0jrt
Topic: 5428 Message: 5433

144.39, while usable, is heavily congested in the KC area and would not be recommended for primary tracking. The balloon groups in the KC area often use 144.99 since it's already I-gated and in fact it is the nationally recommended alternate APRS frequency. Plus, it's in the packet sub-band so there are no frequency / use contention issues.

I didn't hear of any complaints at GPSL last year, but in the past there have been complaints about balloon flights transmitting packets on 144.34 since Wichita, KC, and areas east have a good population of ATV users who use that for a talkback frequency.

For those who wish to use 70cm, 446.175 is the coordinated 70cm frequency for APRS in both Kansas and Missouri. There are at least three full-time I-gates already on that frequency.

I won't get into a debate on the 144.340 issue and will only state my opinion once. The ARRL handbook lists 144.300-144.500 as the OSCAR subband. So a balloon being a LE satellite, it is (in my opinion) justified using those frequencies. End of discussion!

I don't think there will be a problem using 144.34 for such a short duration....I also am thinking of using 144.34 for my multi-mode tracker, but since it's frequency agile, I can put it anywhere in the 2m band (or I could put it on HF)....I'll have it transmitting about 10 seconds worth of DominoEX data at the top of the minute.

I also would like to fly 144.39 at once a minute rate....we'll have to look at time slotting assignments on that frequency....keep in mind that although it may be congested in KC on APRS....we'll be hitting digipeaters 400 miles in all directions so that shouldn't be a problem I would think.

I have a couple of arguments with the report. A meteorite slows as it enters the atmosphere, so it won't hit you at 30,000 mph (unless it's too massive for the atmosphere to slow down and in which case the kid and town would not be existence anymore).

Meteors are also cool when they land (unless again they are too massive). They've cold-soaked for billions of years and a short passage through the atmosphere tends to only heat the outside. Besides, the meteor has to pass through very cold atmosphere on its way to the ground. It's claimed freshly landed meteorites are often covered in frost.

Chances are you'll never see the meteor that strikes you, it would have slowed down some 60-80 miles above you.
Perhaps the kid was hit, but not like the article is inndicating.

Date: 2009-06-16 03:04:06 UTC
From: Nick Hanks
Topic: 5428 Message: 5439

Hi Paul,

I thought the questionnaire the folks used last year for frequency coordination was quite good so here□s our input in that format.

EOSS requests the following frequencies for use during the 2009 GPSL flight.

1) Primary tracking freq requested: 144.34 MHZ

a) Do you have freq agile equip? Yes (Can change to freq to accommodate GPSL ground I-gates or 144.39 MHz to use Kansas City/Lawrence/Topeka area APRS digipeaters). Can also be time slotted. We□d prefer the :00 slot.

b) Call sign & SSID: AEØSS-11

2) Alt tracking freq requested: 147.555 MHz Down, 445.975 MHz Up (Crossband voice repeater and an APRS beacon in one package). We don□t expect this freq to be I-gated

a) Do you have freq agile equip? No

b) Call sign & SSID: W0WYX

3) Other mode freq requested: 426.25 MHz Down

a) Mode: ATV

b) Do you have freq agile equip? No

c) Call sign: AE0SS

4) Other mode freq requested 2: CW Beacon 145.600 MHz

a) Mode: CW (Sends □DE AE0SS□and then tone) once every minute for 30 sec.

b) Do you have freq agile equip? Yes

c) Call sign: AE0SS

Nick

Subject: [GPSL] Fwd: Frequency coordination for GPSL

Yes!!

I need to ask about frequencies in the KC area, since we should be headed generally in that direction.

It seems that the launches I've done so far from KU, that 144.390 was open. Keith, and anyone else familar with the KC area, is that true? I'm stuck on 144.390 for some of my trakers. Is that the case for others?

I'm going to recommend 144.390 be the standard and that we time slot. Does anyone else plan to use something different like 144.36?

Let me know what frequency you'd like to use and a time slot. I'll add that to a new page and email the result back to the list for deconfliction.

I would guess that a more accurate term would be "grazed" rather than "bounced off" his hand. The sound delay he perceived may have been accurate - I'm guessing it would sound something like a lightning strike that happens within a few tens of feet - almost like a rifle shot with echoes off surrounding objects. There is no way his hand could have deflected such an object far off its trajectory and still bury itself in asphalt without causing significant damage.

An extreme amount of luck was involved as had it struck him more substantially it would have caused much more damage.

From: L. Paul Verhage
Topic: 5444 Message: 5448

The glider release is documented in my near space book at Parallax.com.

Essentially, a servo pulled back a wire from a hook and let the cord tied to the glider's tail drop out.

The release occured at 45,700 feet, 45 deg 25.43" N and 92 deg, 27.01" W. I don't have the landing site yet, but taking the boundary between the town and the lake as the landing site, I get that it flew 1.8 miles to the NNW. At release the balloon was ascending at 889 fpm and traveling at 47 MPH at a heading of 108 degrees.

I find it odd the glider flew against the wind to its landing site. Perhaps this will be resolved when I get the coordinates of the landing site.

The mission report (including video of the glider release) is online at http://nearsys.com/arhab/flightdata/2009/c/index.htm

From: BASE
Topic: 5444 Message: 5449

I would suspect that the glider did not significantly interact with the air until it reached a much lower altitude than the release point.

Looking at the atmospheric sounding data from the radiosondes launched from MPX (44.85N and 93.56W)at 12 UTC on 6 June and 0 UTC on 7 June, may help solve the flight path. The surface winds were 5 knots (5.75 mi/hr) or less. However, the winds between 500 and 1500 feet above ground level were between 12 and 25 mi/hr out of the east at 12 UTC 6 June and 25 to 40 mi/hr at 0 UTC 7 June.

Landing to the northwest is also consistent with the flight path taken by the balloon at launch according the the aprs.fi/KD4STH-8. I imagine the flight path had a signficant hook during its descent.

5451. Another high-altitude manned balloon flight this weekend

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-18 02:30:43 UTC
From: Mark Conner
Topic: 5451 Message: 5451

Rich Jaworski is planning another attempt to fly a hot-air balloon to 33,000 feet this weekend. Most likely date for the flight is Saturday, with a launch time of about 5:30am CDT (1030 UTC). Launch site is TBD, but current planning is for a site near Blair NE.

Flight time will be a bit under two hours, and the latest forecast track is for a flight to the southeast about 20 miles (landing N/NE of Council Bluffs).

APRS will be on board with callsign N9XTN-11. I'm not sure if I'll use 144.36 or 144.39 MHz for this flight. IGate support will be available on either frequency, so interested parties can follow along using http://map.findu.com/n9xtn-11 if they're not in RF range.

Rich's last flight topped out at 26,000 ft due to a problem keeping the burners lit in the thinner air. Hopefully he has solved the issue this time.

From: L. Paul Verhage
Topic: 5166 Message: 5452

I have a new gas supplier for GPSL, the same folks that supply gas for my school.

Helium is $73.72 a T-tank and H2 is $33.58 a T-tank.

They will accept uncracked tanks of gas for a full refund.

Starting in July, send me a check for your gas. I'll pay Linweld.

Their store is open on Saturday from 8-11 AM, so we should plan to gas up, launch, and drive tot heir place to drop off ther tank. I told them there would be a bunch of cars Saturday morning in a hurry to dump their tanks. Linweld is located in the northeast corner of Topeka, 100 Madisonc St. If the flights go east, they will be on the way to recovery (more of less).

Now I just need to arrange to store the tanks in welding or put up hooks for the tanks in my classroom.

One of the better documents I've found so far:

http://www.depweb.state.pa.us/deepminesafety/lib/deepminesafety/training/hydrogengassafety.pdf
(copy of a Los Alamos National Lab safety PDF)

Note this document (and others) refer to the "self-ignition" issue with hydrogen cylinders (Google for 'hydrogen cylinder self-ignition' for more). This occurs when one cracks a hydrogen cylinder into free air, usually done to clear dust or debris from the fittings. While OK for other gases, it can lead to self-ignition with hydrogen. This appears to not be an issue when a regulator is attached before opening the cylinder valve. It may also be mitigated with any sort of device attached (Mike's point from earlier that if a flame is generated, it proceeds quickly down the tube and self-extinguishes as the oxygen is consumed).

I admit to being somewhat dubious about this before, but no longer.

Topic: 5166 Message: 5454

Hi Paul,

Would this be possible? Pick the tanks up Sat. morning at the school, fill and launch the balloons, recovery the balloons, and then drop the tanks off at the school to be picked up Monday morning by Linweld. Maybe we could drop the tanks off when we come to the "How Did It Go" session.

My concern is that some folks may end-up out of the chase because they had to go to Linweld after launch and the drop-off time is long and/or the balloon trajectories do not go close enough to Linweld for the folks to get in on the chase. Our experience at past GPSLs is that the chase teams have time for only a very quick pit-stop (e.g., gas, coffee, bathroom) while driving towards the predicated landing sites after launch.

Nick

Subject: [GPSL] It's a Gas

I have a new gas supplier for GPSL, the same folks that supply gas for my school.

Helium is $73.72 a T-tank and H2 is $33.58 a T-tank.

They will accept uncracked tanks of gas for a full refund.

Starting in July, send me a check for your gas. I'll pay Linweld.

Their store is open on Saturday from 8-11 AM, so we should plan to gas up, launch, and drive tot heir place to drop off ther tank. I told them there would be a bunch of cars Saturday morning in a hurry to dump their tanks. Linweld is located in the northeast corner of Topeka, 100 Madisonc St. If the flights go east, they will be on the way to recovery (more of less).

Now I just need to arrange to store the tanks in welding or put up hooks for the tanks in my classroom.

I would also advocate not trying to return the tanks during the chase - it's doubtful Linweld can process all of us in a timely fashion. For teams with multiple chase vehicles it may be possible to detail one to go to Linweld, but for NSTAR we'll only have the one.

For GPSL 2005, Linweld gave us free delivery/pickup since we ordered such a large quantity. I stored the cylinders (18) in my garage - they delivered Thursday or Friday and picked them up Monday. I had to arrange transport to/from the launch site but that was not a major issue. I had 7 or 9 on a trailer and the rest on two pickups. Since Taylor or DePauw (can't remember which) had their base station at the launch site, we left the tanks there during the chase and took them back home later that day.

I mentioned dropping off the tanks as an option. I agree that if there is going to be a time crunch, the tanks will come back to the school after recovery. The school alram will be turned off and I can unlock my classroom.

A T tank is 192 cu ft.

How can there be such a discrepancy in prices for the most abundant element?

The welding supply house where I go has a whole dock full of it as one customer of theirs uses 8 -10 T tanks a week plus other users. I don't get it.

I jusrt got off the phone with Linweld.

The T-tanks we ordered have 330 cu ft of gas.

Any tank we say we didn't open, they will gauge to verify and give us a refund.

Thanks, Mark. That's a great reference.
And my sources for the earlier caveat are Norm Kjome of U Wyo and
Mike Morgan N0MPM, an engineer with Conoco.

Boy, you sure can see how those shards are dragging tbe 'chute apex
around! The good folks at Colo Space Grant are doing mech drawings
of the EOSS fast release that gets shut of those shards right at
burst, every time. And there's a chance that they can even CAD/CAM
the parts for a kit. We've used ours on every flight for the past
two years.

BTW, I've corrected the problem with early release during a jerky
launch by balancing the locking arm.

I suspect that we've had a meteor hit on a balloon. One was a
3000 gm carrying a normal neck load of about 26 lb that burst
at about 65K' rather than the normal 90K'+. Another was a new
1200 gm Totex that entered a float at 45K'. I've heard of other
instances where a latex got punctured without inducing a full-blown
burst.

At the altitudes we fly at, there's not enough atmosphere above us
to allow even tiny meteors to burn up completely.

Anyone up for a mess of flights during the Persieds shower?

Or not ... l=P?

Most meteroids are vaporized between 60 and 80 miles altitude. It's because of their incredible speeds that they never make it down to near space altitudes. The typical meteoroid that makes it to our altitude are at terminal velocity, so they're probably tumbling at less than 200 MPH. There are no small meteor craters on Mars because even with its 7 mb atmosphere, there's enough air to stop a lot of meteoroids (By the way, I purchased an 8 mg fragment of Mars meteoroid recently).

Now really big stuff - the kind of stuff that makes large impacts - is too large for the atmosphere to slow down. So they hit the ground with kinetic energy levels beyond our daily experiences. Testing with bullets lead geologists in the 19th century to dismiss the Barriger Crater in Arizona as just a crypto-volcanic (mystery volcano) structure.

5470. Drop Sondes Idea

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-21 04:16:28 UTC
From: L. Paul Verhage
Topic: 5470 Message: 5470

After mulling over the CricketSat idea for a while, I'd like to give something very similiar a try.

The transmitter operates at 434 MHz and costs $4.00 (see http://www.sparkfun.com/commerce/product_info.php?products_id=8946). I'd like to use a PICAXE-08M that costs $3.00 (see http://www.sparkfun.com/commerce/product_info.php?products_id=8308) to send a square wave to the transmitter and then cut the antenna to the 3rd harmonic (144.67 MHz).

The PICAXE will switch the square wave on and off to send the temperature from a LM335 read with its 10-bit ADC.

I'm wondering if we could hear and record data from a 10 mW transmitter on the third harmonic and then fox hunt it if I dropped it from a balloon. Also, would anyone in the Topeka area be interested in helping me test this? This would be a $10 (and therefore if it gets lost, no big deal) near space drop sonde and perhaps a fun fox hunt.

Hi Paul,

I've done several flights with that exact SparkFun 434 MHz transmitter module....it puts out about 10 milliwatts ... I attach a dipole to it directly to the module.

I AM modulate it to eliminate the frequency drift and to allow those who don't have SSB rigs to monitor it....basically just turn it on/off at audio rates to get the CW and RTTY tones in AM mode....following is some code for the Arduino and a schematic on how I get it all to work....with a 9-volt lithium and a pressure transducer, the total payload weight is about 3 ounces....you should be able to do a similar thing with the Picaxe.

http://www.wb8elk.com/projects.htm (http://www.wb8elk.com/projects.htm)

You can also key it with CW mode if you have an SSB rig on 434 MHz....but it does drift with temperature.

With a 3-element Arrow antenna I get quite good signal strengths and have heard it well enough to copy data even when it's over 100 miles downrange...preamp at the antenna is helpful at this range though.

I am going to try putting one of these on a parachuting Sponge Bob next week and plan to release it on the way up for some students during Field Day.

I just flew my multi-mode tracker without it's amplifier section....about 10 milliwatts on 2m FM....nice signal levels out to 40 miles with a 3-element Arrow on the ground....upwards of S-5 throughout the flight using DominoEX mode....that system weighed in at 5 ounces complete with built-in GPS and antenna....but it proved to be a bit too much for the 9-volt lithium when it got cold....more insulation needed....it did come back to life as it warmed up on the descent though. That one was heard 200 miles away by Hank W4HTB.

Hey Bill, I remmeber you talking about this last year at GPSL. I was lookiing at the CricketSat plans and see they use a 555 timer and decoder chip. I figured using a PICAXE-08M woud be a cheap subsititute.

Thinking it over again, I see the transmitter operates in the 70 cm band, so I don't have to pull the 3rd harmonic out of it. So I'll try to get CW out of it like you do.

Thanks,
Paul

Hi Paul,

Two problems:

1. The 3rd harmonic of 434 MHz is 1302 MHz. There is no 2m-band energy in any waveform that has a 434 MHz fundamental. Better to use a lighter 434 MHz antenna and track it there. And it'll need a CW ID to boot.

2. 14 CFR 101.5(b) prohibits dropping stuff from a balloon if (big if!) it "creates a hazard to other persons or their property.", and there's no exemption from that requirement. Now, one would be hard pressed to show how your "Idaho potato bomb" might create such a hazard, (unless one considers coronary atherosclerosis), but this 1/2 lb missile in free fall? Owie! A PVC "crime scene" tape might retard its descent rate to what might be arguably "safe", however,

I was thinking the wrong direction in regards to the harmonic. I now realize the primary frequency is well within the amateur 70 cm band, so I'll stick with that.

The transmitter, PICAXE, temp sensor, battery, and voltage regulator should be less than 3 ounces. I'll fit it into a 6 inch dameter styrofoam ball and drop it on a parachute. Making an asumption on its drop rate, we can create a temperature profile of the atmosphere.

I wonder if I can record this data on the near spacecraft and download the data after recovery.

Eventually I'd like to do overnight missions for a Field Day Super Launch and release dropsondes like this every few hours.

You could, of course, install a divider chip, and use that to get
a subharmonic (although division by three can be tricky). But,
70 cm will probably be easier to deal with than 2 meters (Less
crowded, easier/smaller high gain antennas, etc.).

> The transmitter, PICAXE, temp sensor, battery, and voltage regulator should
> be less than 3 ounces. I'll fit it into a 6 inch dameter styrofoam ball and
> drop it on a parachute. Making an asumption on its drop rate, we can create
> a temperature profile of the atmosphere.

Free-fall=bad. Parachute=good. Padding=extra-good. :-)

Plus, using a parachute will give the temperature sensor time to
respond. However, beware the insulating effects of the
styrofoam all (Preaching to the choir...).

The drop rate won't be linear, of course, but you can probably
come up with an appropriate fit, based on some atmospheric density
assumptions.

> I wonder if I can record this data on the near spacecraft and download the
> data after recovery.

That might be an option, or you might think about connecting a
serial EEPROM on the drop capsule to record the data (Or course,
that means you'd have to recover the capsule.). And, it means
you'll have to come up with a system for reading the data out.

> Eventually I'd like to do overnight missions for a Field Day Super Launch
> and release dropsondes like this every few hours.

Put an LED on it so it can be tracked visually? Actually, I've
wondered how far away you could see a pulsed "super-bright" LED
from. Might be an interesting night launch opportunity.

5477. OT: long-range wireless thermometer

Yahoo group: GPSL (2009 — 2010)
Date: 2009-06-23 03:27:48 UTC
From: Mark Conner
Topic: 5477 Message: 5477

I've given up on consumer-grade wireless thermometers - either the remote units fail within a year, or they are too weak to transmit through the steel siding we have on the house. However, I'm not ready to spend the $$ on a Davis weather station either. I'm wondering if any of the balloonists out there have made their own wireless thermometer that doesn't require a lot of esoteric parts or a lot of time to tweak (any time I spend on this comes out of the time I could spend on balloon payloads).

I'd like something that has a free-space range on the order of 500-1000 ft and can be powered for a reasonable period of time (year?) on the remote's batteries, and the indoor unit can either be on a wall wart or also on batteries. I think wireless radios like the XBee are probably overkill, but the $4 315 or 434 MHz transmitters may not have enough oomph to make it through the siding reliably. I'm figuring something like the PICAXE chips would be well suited to be the brains on both ends.

Anyone have any thoughts on this?

Download the AOL Classifieds Toolbar for local deals at your fingertips.
Hi Paul,

  I've done several flights with that exact SparkFun 434 MHz transmitter module....it puts out about 10 milliwatts ... I attach a dipole to it directly to the module.

  I AM modulate it to eliminate the frequency drift and to allow those who don't have SSB rigs to monitor it....basically just turn it on/off at audio rates to get the CW and RTTY tones in AM mode....following is some code for the Arduino and a schematic on how I get it all to work....with a 9-volt lithium and a pressure transducer, the total payload weight is about 3 ounces....you should be able to do a similar thing with the Picaxe.

http://www.wb8elk. com/projects. htm

  You can also key it with CW mode if you have an SSB rig on 434 MHz....but it does drift with temperature.

  With a 3-element Arrow antenna I get quite good signal strengths and have heard it well enough to copy data even when it's over 100 miles downrange... preamp at the antenna is helpful at this range though.

  I am going to try putting one of these on a parachuting Sponge Bob next week and plan to release it on the way up for some students during Field Day.

  I just flew my multi-mode tracker without it's amplifier section....about 10 milliwatts on 2m FM....nice signal levels out to 40 miles with a 3-element Arrow on the ground....upwards of S-5 throughout the flight using DominoEX mode....that system weighed in at 5 ounces complete with built-in GPS and antenna....but it proved to be a bit too much for the 9-volt lithium when it got cold....more insulation needed....it did come back to life as it warmed up on the descent though. That one was heard 200 miles away by Hank W4HTB.

The same NPR report noted that there was only ONE lab on the planet that could process Kodachrome - in Wichita, KS IIRC.

That was GREAT film, but yeah, a 10 Mp camera with a good lens can pretty well match the performance of 35 mm Kodachrome. Now we just need SDcards that will keep images intact for 50 years!

Never mind astrophotography.

kodachrome was my first color film to do astro work. ectachrome too was awesome.

Yes the CCD's now make images that blow away any image made using film, but film cost a few bucks, show me a decent astro ccd that doesn't cost a kilobuck!

Hi Ralph

The Saskatoon Amateur Radio Club will be launching its 6th balloon, SABRE-6 from the VE5AA Field Day site.

Location:
Western Development Museum, Saskatoon, Saskatchewan
http://www.wdm.ca/stoon.html
52 04 44N - 106 40 18W

Frequencies:
VE5AA-11 - 144.390 - APRS plus telemetry
VE5AA-12 - 144.390 - APRS
VE5AA - ATV - 439.250
CW beacon - 222.150

Tracking:
http://aprs.fi/?call=ve5aa-11
http://aprs.fi/?call=ve5aa-12

For more information, visit our club web site at http://ve5aa.dyndns.org

Joe,

I thought that Line A only reduces the available 70 cm band to 430-450 MHz and is based on the location of the transmitter.

Hey, what's this "Line A Rule" and where's it imposed?

EOSS has flown DSB AM NTSC ATV with a carrier on 426.25 MHz since EOSS-1
back in 1990, and no one has ever nicked us. In fact, in the rare cases where
we've flown two ATVs simultaneously, we DID get gigged when a sideband from
the 439.25 xmtr got into the input of one of local repeaters in Colo Springs.

During GPSL a couple of years ago, EOSS and Bill WB8ELK both flew ATV on
426.25, and we arranged to time-share the freq 50-50 in 2-minute cycles.
This did requires us to sync up before launch, but it did appear to work
OK, despite the imprecise time bases used for that "slotting" scheme.

This is a worthwhile watch. Covers Space Data's DoD work, with a bit
on its balloon-borne cell site system.

Wish there was more on the special latex formulation for UV-resistance, but
I guess that's proprietary. But I've heard thru the grapevine that these
balloons have about a 30% launch failure rate attributable to development
of an bubble or aneurysm on the top.

Space Data's StarFighter Repeater Platform, currently in use by the
United States Air Force, extends the range of standard issue military
two-way radios from 10 miles to nearly 500 miles. The concept is simple:
fill a balloon with helium or hydrogen and attach a Space Data radio
repeater payload. Once launched and on its way to a roughly 80,000-foot
float, a StarFighter Platform provides users' portable radio systems
with the same communications coverage previously available only via
bulky and expensive satellite equipment.

Here's the "Line A" rule from Part 97.303:

To Quote the FCC Part 97 Regulations, The Rule for Line A was found in The FCC Part §97.303 Frequency Sharing Requirements: (f) In the 70 cm. band: (1) No amateur station shall transmit from north of Line A in the 420-430 MHz segment.

Thanks to Joe for the link. I guess I was aware of that rule, but didn't give it much thought, since we've never flown anywhere close to that line, much less "from north of" it; I take the latter phrase to mean the location of the transmitter, not its radio horizon. So the IARU probably took terrestrial 70cm props into account when making that rule. And even if the radio horizon from a balloon ATV xmtr goes that far north, it's likely too weak to interfere with a transmission from any public service station in the network; even using an 18 dBi az-el yagi and 1 dB LNA, we get no better than P3 ATV past 50 miles downrange.

So I guess I'd not fret about it so long as the balloon's lat/lon conforms with that rule.

Line A has been a real thorn in the side of ATV operations for those who are near the Canadian border....in fact, Line A extends quite some distance into the US...(about 70 miles or so south of the border).

The fact that it exists at all?could potentially mean that we could eventually lose 420 - 430 MHz in the US once a land mobile service?makes a grab for it and shows the Canadian precedence.?

I should know since I used to live just 1 mile south of Line A in Findlay, Ohio...in that region 41.00 deg N is the cutoff point.
It's my understanding that as long as your ground position is below that line A...then regardless of altitude, you are ok....although I've never flown 426.25 MHz on a balloon from Findlay....I could do so as long as the balloon's flight path kept below 41 deg N
Line A's boundary is complicated...it's only 41 deg N in that portion of Ohio....basically it's about 70 miles south of the Canadian border.

Mike Manes wrote:

Hey, what's this "Line A Rule" and where's it imposed?

EOSS has flown DSB AM NTSC ATV with a carrier on 426.25 MHz since EOSS-1
back in 1990, and no one has ever nicked us. In fact, in the rare cases where
we've flown two ATVs simultaneously, we DID get gigged when a sideband from
the 439.25 xmtr got into the input of one of local repeaters in Colo Springs.

During GPSL a couple of years ago, EOSS and Bill WB8ELK both flew ATV on
426.25, and we arranged to time-share the freq 50-50 in 2-minute cycles.
This did requires us to sync up before launch, but it did appear to work
OK, despite the imprecise time bases used for that "slotting" scheme.

Hi Joe

You've started an interesting discussion here.

I think intent of the rule is to prevent intentional transmission into an area that doesn't permit it rather than preventing any possibility of it. As others have mentioned, the amount of energy on a given frequency other than the video and audio carriers of an ATV signal is quite small. Put that together with the population density of Canada adjacent to the boarder and the likelihood of actually causing interference is very small except in south west British Columbia, Ontario, and south west Quebec. Even there, you would only be at an elevation that could interfere for an hour or less except for long duration flights. There are lots of situations where signals from south of Line A might unintentionally enter Canada such as ducting or meteor scatter. Line A is just an attempt to prevent knowingly causing interference.

Besides, being the polite people that we are, we'd probably just invite you over for a brew and forget about it all afterward. ;-)

SABRE-6 was launched and recovered. We had a few technical issues. One tracker failed at liftoff and the second one failed on decent at about 46000 feet. We had to use old fashioned DFing of the 222 MHz beacon to track it. It took us an extra hour to find it but we finally did. We also had lift problems. Our original payload was about 2Kg. After draining 2 full 79 cu-ft tanks, we only had enough lift for the tracking and payload and had to disconnect the ATV payload leaving us just over a kilogram of payload. Even then we only had 800ft/min of lift and only achieved 77,000 feet. We're not sure but we suspect that our Helium may not have been very good, far less than pure. We've lifted the same payload in the past with less Helium in the past.

We were fortunate to have 2 TV stations with video crews out for the event and we got our pictures to the TV stations in time for the supper and evening newscasts. I also did an interview with CBC Radio's Morning Edition this morning. Great publicity for ham radio.

A full write-up complete with pictures will be on our web page in the next few days.

Hi Ralph

The Saskatoon Amateur Radio Club will be launching its 6th balloon, SABRE-6 from the VE5AA Field Day site.

Location:
Western Development Museum, Saskatoon, Saskatchewan
http://www.wdm.ca/stoon.html
52 04 44N - 106 40 18W

Frequencies:
VE5AA-11 - 144.390 - APRS plus telemetry
VE5AA-12 - 144.390 - APRS
VE5AA - ATV - 439.250
CW beacon - 222.150

Tracking:
http://aprs.fi/?call=ve5aa-11
http://aprs.fi/?call=ve5aa-12

For more information, visit our club web site at http://ve5aa.dyndns.org

Hi Bruce,

You didn't mention the balloon size and total neck load, but 158 cu ft of pure He should have hauled up 1.8 kg at 1000 ft/min. It's possible that you got "balloon gas", which has a lot of N2 mixed in to keep party balloons inflated even after the He leaks out thru the latex pores. This has tripped up more than one balloon group!

And it sounds as though you could use a lot more thermal insulation, or run a cold soak on the beacons to see where they quit. Ours still operate at -15C.

FB on Dfing the 220 Mhz beacons, however. Well done, the hard way!

Better luck next time,

Hi Mike

Thanks for the tip about the N2. That makes complete sense. I didn't know about that. I really want to try Hydrogen mostly for price but perhaps for predictability too. I'll be watching the demo at GPSL closely.

Our internal temperature never dropped below about +15C so I don't think it was the cold. Real mystery. Oh well, that's what it's all about.

Hi Paul,

Just two small changes to your file. Our count to Garmin went down by two to 17 and our attendees at the tech session went down by 1 to 13.

How did the conversation with Linweld go? Curious as to the size of the $73.22 bottles of helium with regard cubic ft. and size designation (T or K).

We're set to go and looking forward to this year's GPSL.

Hi Bruce,

Hmmm ... could be that you got some GPS receiver desense from an xmtr in the same package? We fought that with 70cm AM ATV and ended up moving the GPS to another payload over 10 ft down the line and linked it to the ATV overlay using 2.4 GHz Zigbee.

PBC may have taken out your 2m beacon antenna, but that would have been obvious on recovery. But are you certain that your payloads can withstand even +15C? That's pretty warm, but worth checking anyway.

And yeah, H2 is the coming thing. Biggest obstacle is flammability, and perhaps to an even greater extent, the Hindenburg Effect! Good idea not to coat your balloon with gunpowder.

5504. Repeaters

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-01 03:15:03 UTC
From: Nick Hanks
Topic: 5504 Message: 5504

Hi Paul,

I see there is a list of area repeaters on the 2009 GPSL website. But there doesn't seem to be any listed for Topeka. I found a couple of listing with Topeka repeaters in them on the web, but my experience is that these listings are not necessarily accurate. Could you point us to some active repeaters?

Thank you.

Nick

I've updated your attendance and just got off the phone with Linweld. We have reserved 12 T-tanks of helium at 330 cu ft per tank and one t-tank of H2. I'll give them anoher call the Monday before GPSL.

5506. Topeka Repeaters

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-01 15:10:49 UTC
From: L. Paul Verhage
Topic: 1354 Message: 5506

I need a current list of repeaters for the Topeka area. Can Alpha Ares reply back to this email with that information.

I also need to know if any of the local radio club would like to attend or help out. Sorry I can't make this week's meeting.

Onwards and Upwards,
Paul

5507. GPSL Schedule

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-01 15:22:42 UTC
From: L. Paul Verhage
Topic: 451 Message: 5507

The back up launch site has been moved to Banner Creek Reservoir, north of Topeka off US 75. I'll visit them to get a picture, GPS coordinates, and the exact launch sites (I think it will be just inside their main gate - north side).

I have 51 attendees and need to know numbers for Joe Lynch and ARBONET. I'm assuming everyone will want to have lunch at the conference? It should be $15.

Please start sending in those checks for your gas. My address is 6114 SW 27th #3, Topeka, KS 66614.

Don't forget, CQ VHF has paid for the Topeka showing of the movie Blast! (about high altitude ballooning research at the South Pole).

I have 50 people for the Garmin tour. I need a number of people going on tour from Loughmiller.

We have six presentations and this is how I've set them up. Please let me know if you'd like to switch. Surfing Satellites, can you call in at 2:45 our time?

8:00-8:30 Doors Open/Registration Begins

8:30-9:00 Social Time/Networking/View Displays

9:00-10:00 Welcome/Introduction by Groups/What’s New

10:00-10:15 Break

10:15-10:45 Presentation 1 (Paul Verhage)

10:45-11:15 Presentation 2 (Nick Hanks)

11:15-11:45 Presentation 3 (Bill Brown)

11:45-1:00 Lunch

1:00-2:00 National Organization Discussion

1:30-2:00 Presentation 4 (ARBONET-3)

2:00-2:15 Break

2:15-2:45 Presentation 5 (Gopher Launches)

2:45-3:15 Presentation 6 (Surfing Satellites – call in)

3:15-3:45 Presentation 7?

3:45-4:00 Weather/Flight Prediction

4:00 Adjourn

5:00 Dinner

5514. BBE and EBBE contacts on 18 July

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-01 20:18:34 UTC
From: BASE
Topic: 5514 Message: 5514

Dear friends,

I wanted to remind everyone of the possibility of Balloon-Balloon-Earth and Earth-Balloon-Balloon-Earth contacts during our common flight time on 18 July.

I will be flying a cross band repeater for the Scouts at SpaceJam 3. The uplink frequency is 144.36 MHz which I know several of you are using for your APRS tracking. The downlink is 446.025. I'll have the Scouts pay attention to any balloon based APRS traffic that comes down. The radio line of sight distance for two antennae at 70 kft is almost 750 miles, and our balloons will be about 420 miles apart. I plan to launch at 8 am Central Daylight Time (1300 UTC) and use a float valve to stay at 70 kft for a couple of hours. If you launch at 9 am CDT (1400 UTC), we should already be above controlled airspace and waiting for contact. If the winds don't permit floating, I'll launch later and climb slower with burst above 95 kft which might allow direct contact.

I believe the Scouts will be using the call sign of the Troop and Crew 272 which is WB9SA.

If I'm not too busy with the tracking and recovery, you can always try my call sign KC9QBN (yes, I finally took the Tech test.)

I'd appreciate knowing what frequencies and repeaters that any of you might be flying at GPSL.

73,
Howard

Joe,

We'll be launching from the Chanute Air Museum (formerly Chanute Air Force Base) in Rantoul, IL.

The balloon will be a 1200 gram Kaymont. The float valve is a design prototype from StratoStar systems. As I understand the valve, it communicates via the 2.4 GHz Zigbee with the command radio pod that has the GPS antenna. The valve is set to open (I don't know the exact valve structure, but it seems similar to the WB8ELK valve with a ball held by a string/spring in the open end of the tube) at lower altitude and closes when the ascent rate reaches almost zero feet/minute. The valve and controls are contained in a 3/4 inch tube that fits into the standard neck of the Kaymont balloon. The float valve also has a timer that insures that the valve opens at a preset time limit to serve as an additional cutdown mechanism.

Subject: Ballooning

My name is Isabel and I am a participant in UM-BOREALIS. Like you, we launch and track high-altitude
balloons using amateur radio and GPS Systems.

Did you use WinAPRS for track at all? If so, we have a few questions about it.

What transmitting hardware did you use, and did your packets (latitudes, longitudes, altitudes)
include a timestamp?

Thank you,
Isabel H.

Paul,

I just spoke with Mark (N5OTD) of NWTI. Instead of a combined flight, ORB and NWTI will be doing one flight each. We will try to launch and track as one team. They will be bringing He for me so I will not need a tank.

Billy (N5QEM) NWTI was going to send you an email. In case he didn't, they will be using 144.340 for APRS.

5520. Cell Phone coordination for GPSL

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-04 17:34:01 UTC
From: Harry M
Topic: 5520 Message: 5520

Paul,

In the past we have made available our cell phone numbers with GPSL participants in case we are out of radio range and someone needs help on recovery. I suggest everyone supply you with their number and the list be made available at the lecture. Some, like me, do not want to make their numbers public so I will send mine via private email.

Good morning Ralph

We had to cancelled this the flight for the third time, for a reason other
then rain .

Two different ballons a 350 and a 800 g were found to be bad, those ballon
were about 4 months old as they were purchased from kaymont in March,

They were kept in their original bag in the dark . But I did notice some
unaven color shade .

I was also wandering, why are their not packed in a cardboard box or
something better than a clear plastic bag, if the are sensitive to light ?

I would appreciate your opinion and comments on that as I dont have much
experience.

Thanks

Michel

Bon soir, Michel,

Kaymont has been pretty good about shipping balloons in sealed containers to
us. The discoloration is not all that bad, but the cut shown in the 2nd image
is definitely a show-stopper.

Is it possible that the original container was opened for customs inspection?

In any event, I'd urge you to get back with Paul Fetkowitz at Kaymont:

paul@...

and show him those pictures. He's always been very cooperative with
EOSS in resolving shipping issues, not that we've had many.

Paul,

We plan on using the following tracking frequencies:

144.930 for primary tracking - time slot at 0 & 30 seconds.

144.990 for Secondary tracking - time slot at 30 seconds.

Primary tracker is freq agile
Secondary has limited freq agility

No other RF planned except for low power uhf beacon on 433.975

I had posted this once before, so in case it got lost, here it is again.

ORB would like to use 144.340 xmt / 144.240 rcv
No time slot and transmitting every 30 seconds.
The .240 rcv only is for cutdown.

From: Mark Conner
Topic: 5534 Message: 5534
Attachments: 1 described; binary payloads are missing from this source WARC

GPSL attendees (and others who might be interested),

The GPSL 2009 shirt is now ready for ordering. Go to this link:

http://www.zazzle.com/gpsl_2009_t_shirt-235625382377116629

Please note you will need to 'customize' the front of the shirt with your name and/or callsign. Otherwise you'll get a shirt that says "Your Name and Callsign Here" printed on the front!

You should probably order the shirt within a day or two to ensure delivery to your home before GPSL. If you start to run close on time, you may be able to have it sent to your hotel instead. Sorry for not having it done sooner - it's been a busy couple of weeks.

Any questions, please let me know.

I will set my tracker to time slot at 10 sec past the minute.
This will resolve any conflicts. I think NWTI will also
be using 144.340. I will request that they slot at 15 sec
past the minute. I should hear from them this weekend.

5545. Tracking Frequencies

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-09 16:01:19 UTC
From: L. Paul Verhage
Topic: 5545 Message: 5545

Here's what I have so far. Please let me know what needs to be changed and I'll report again.
--
Onwards and Upwards,
Paul

Frequencies

NSTAR will be using 144.36 MHz for its main tracker and 144.39 MHz for the backup (once per minute). I can time slot both.

EOSS can run on 144.39 at 0: and 30: past the minute. Or move to another freq if there are others being I-gated.

NearSys will use 144.39. I can set my transmit time (I believe I am currently using :15 and :45)

144.930 for primary tracking - time slot at 0 & 30 seconds.

144.990 for Secondary tracking - time slot at 30 seconds.

Primary tracker is freq agile

Secondary has limited freq agility

No other RF planned except for low power uhf beacon on 433.975

Ron Cathcart

ORB would like to use 144.340 xmt / 144.240 rcv

No time slot and transmitting every 30 seconds.

The .240 rcv only is for cutdown.

K0NMS on 144.99

I will set my tracker to time slot at 10 sec past the minute.

This will resolve any conflicts. I think NWTI will also

be using 144.340. I will request that they slot at 15 sec

past the minute. I should hear from them this weekend.

Harry KC5TRB

I just spoke with Mark N5OTD (NWTI) and they

will use 144.340 slotted at 15 past the minute.

Mark will verify that in an email to this list tomorrow.

Paul,

I spoke with Nick (EOSS) and it looks like this for 144.340 so far.

EOSS 144.340 slotted @ 0 & 30
ORB 144.340 slotted @ 7
NWTI 144.340 slotted @ 15

This still leaves room for someone else to use the freq.

We also discussed the open slot for presentation-7 and thought it would be a good idea to have an open discussion on balloon born video. Start the discussion and call up to the podium anyone that has flown video and talk on the equipment and setup they have used.

Nick also mentioned a third launch site that I do not see on the web site.

5550. Proposed ATV system for Ballooning Flight

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-10 01:08:26 UTC
From: BASE
Topic: 5550 Message: 5550

Dear friends,

I need your feedback concerning the following ATV communication system for the BASE 38 balloon flight at SpaceJam-3 on 18 July.

The proposed system will use:

Z70A 4 Channel 70cm ATV Transmitter from P.C. Electronics

http://www.hamtv.com/videolynx.html#Z70A

The power output is 50-100 mW.

The transmit antenna will be a little wheel, a la EOSS.

http://www.hamtv.com/wheel.html

Have any of you used the ground reflector described at the end of the web page? It seems like it could be a critical addition.

The Ground Station will be a Sat/Comm setup with M2 circularly
polarized Beam antennas, SSB preamp, a VCR with Cable 58 in and ch 3
out (we will record with the VCR), and put the video out on a 32" big
Screen TV.

Current predicts will keep the flight path fairly short(30 mi/50 km) till burst. Ralph Wallio's spreadsheets (see http://showcase.netins.net/web/wallio/LINKbudget.html and http://showcase.netins.net/web/wallio/SNT.html) to calculate link budget and system noise temperature have led me to see your input.

Thanks for any and all thoughts,
Howard

From: Zack Clobes
Topic: 5550 Message: 5551

We've used the HamTV transmitter with good success. The best luck that we had was an APRS payload, with four load lines going down through a Little Wheel (home made antenna that was sandwiched between two sheets of blue or pink Styrofoam), then down to an ATV payload. We separated the Little Wheel from the payloads, because we had a lot of problems with the 440 video desensing the GPS receiver. We sandwiched the antenna in the Styrofoam to give it some rigidity and to protect it.

On the ground, we played with different antennas including those circular satellite antennas (can't think of what they're called right now - they have a reflector and a helical coil that's driven), but in the end, we found the highest gain beam we could afford to be best - the balloon moves and rotates so no matter what polarity you receive in, it's going to be wrong.

Date: 2009-07-10 01:23:39 UTC
From: Joe
Topic: 5550 Message: 5552

Howdy base,

Thoughts,

In my opinion the 50 to 100 mw ATV sig, at 30 miles I'm thinking might be pushing it. We usually run 3 watts, and get decent pictures out to 100 miles. but 100 mw is a far cry from 3000 mw.

The reflector is a good Idea, xcept we don't go for the short distance as seen there, we don't need a super strong signal directly under the payload, Thats the shortest distance. we usually go 5/8 wave spacing, this provides a decent lobe out towards the horizon, and a small lobe directluy under the payload.

MY BIGGEST concern is to test your equipment first. hook it up, and make sure it will record SNOW! no ATV signal. Just set the recorder on freq, and hit record. and make sure it can record snow. we went through dozens of them not to find a single one anymore that will record snow. Most,, well actually everyone that was less than 5 years old would NOT do this if the signal is not strong it goes to blue screen.

And on a ATV balloon flight this is fatal. If you can not record Snow, you won't be recording much of any of the flighht.

Hi Howard,

That's a pretty puny xmtr for getting a decent signal beyond 10 or 20 miles downrange. EOSS uses a 1W KPA-5 with an 18 dB yagi and 1 dB LNA, and our signal drops to P3 at about 50 miles downrange.

We don't use a ground plane above our little wheel, since by the time we get far downrange and in descent, we need max signal straight out to the side; the ground plane aims the main lobe downward 10 or so degrees.

The little wheel is strictly a horizontally polarized antenna, so using a CP ground station antenna will only hurt your SNR, since it will be picking up sky noise up to 3 dB above what you'd get from a simple horizontal yagi. The good news is that you can simply disconnect the phasing harness and connect your feedline directly to the horizontal yagi.

I'm not sure what the noise figure of your Ch 58 TV set might be, but it's quite likely to be poorer than what you'd get from a PCE GaAs 70 cm downconverter. And the PCE xmit freq isn't dead on cable Ch 58, so if your TV set doesn't have a wide AFC range, you may lose the signal as it gets noisier.

Aren't you glad you asked (not)? :=P

Not real sure what your asking. If it is "show me the data from
NOAA", there's a link called:

Raw text of ARL READY report.

On the last page. That will give the data the system used to
calculate with.

Does this help?

From: BASE
Topic: 5563 Message: 5563

Dear friends,

Thanks again for the many notes, both on group and directly, about the ATV flight with the Scouts (BASE 38).

Based on the recommendations, we are changing several factors:

1. Will use the VM-70X transmitter from P.C. Electronics with the power between 1 and 2 Watts. I will use a large heat sink on the transmitter.

2. Transmit frequency will be 439.25MHz (channel 60)

Calculations from Ralph's pages indicate we should have between P3 and P4 quality video at 50 km.

I'm not sure a prediction this far out is meaningful but for the past two days I've used the 1800 UTC. It is the closest to our proposed launch time but as we get closer to the date I'll move it up to eventually the 1500 or even better if possible.

I have one of their transmitters with the camera, video overlay, and I
believe it has the ~1W amp too. If you'd like to borrow it, just let me
know.

Topic: 5560 Message: 5568

I ran one online just now using today's 18Z model output and the forecast for next Saturday at 18Z and got a bearing of 131 degrees and distance of 51 miles, using 1000 up/1000 down/90,000 burst. Seems OK from the wind profile.

By next Tuesday or so it'll start settling down and offering something useful. However, the upper level forecasts are consistently indicating northwesterly flow but varying in speed. In general I think we're looking at a SE track of some flavor, and perhaps more distance than we're used to seeing in mid-July. It would be nice for the helium transport issue if we can fly from Topeka.

Hi Everyone

Is anyone interested in car pooling for the Garmin tour? My wife and I are staying at the Motel 6 in Topeka. We'd be glad to chip in for the travel cost if someone else is driving anyway.

See everyone next week

Here's what I recorded for launch site coordintes

Primary: Mission Valley HS 38 deg 53.162' N and 96 deg 00.040' W

Secondary: Banner Creek 39 deg 27.685' N and 95 deg 46.760' W
Everyone can start using those for predictions

Attachments: 1 described; binary payloads are missing from this source WARC

Decimal conversion for prediction programs:

Mission Valley: 38.886033,-96.000667
Banner Creek: 39.461417,-95.779333

KATS is within 5-6 miles of both Topeka Muni and Forbes Field ANG Base, so it's probably better that we use something out of town for this many balloons.

I attached a prediction from this morning's GFS run. The hook to the west will probably be sharper and farther west than the prediction says - the wind details above 50,000 ft are pretty coarse in the model. Our flight yesterday took us almost 10 miles farther west than expected, and this was after making some adjustments.

It's not Kaw because that's in town. I suppose we could look at a launch there. Are we going to run into problems with the airports if we launch from there?

It would certainly simplify the helium tank issues.

I don't mind an extra drive in the morning if it's a safer launch setup - neither site is all that far. While Topeka Muni and Forbes ANGB aren't that busy and are only in Class D airspace, it is an extra risk especially with so many balloons. It does complicate the helium issue, as most of us will have to carry the tanks for the chase unless we can make arrangements to stash the cylinders on site.

Most likely they coordinate with Topeka tower or approach control
prior to release - that's what the Omaha upper-air station had to do
when it was located near the airport prior to its move to Valley in
the 90s.

If we can do the same, that lowers our risk substantially.

Paul,

I have made it thru Monday and will be able to take off Thursday & Friday.

I will be attending the Garmin Tour and the Conference. I will make my own arrangements for lunch on Friday.

Would it be possible to pick up the H2 cylinders on Friday at the confernce ?

Best Regards,
Nick K0NMS

5591. EOSS GPSL Travel Plans

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-14 14:25:14 UTC
From: Nick Hanks
Topic: 5591 Message: 5591

EOSS will depart Limon, CO tomorrow morning (Wed.) at 0730 (0830 CDT) for Topeka. There will be six vehicles all running APRS with a -6 SSID. We expect to be in the Topeka area about 1600 CDT. We'll give a call on the 145.27 MHz repeater as we approach Topeka. Enroute simplex frequency is 146.55 MHz.

We'll have mobile Web access so we'll be I-gating ourselves and put out tweets. You can learn all about Twitter and how to join at http://www.eoss.org/twitter.htm. We be sending out tweets on our way out and back, while we're in Topeka, and on Saturday during the launch and recovery activities. Our Webmaster N0KKZ has put together an excellent tutorial on getting started. And you can only subscribe to EOSS tweets if you want.

In addition, two of the vehicles have HF capability and will be monitoring 7.275 MHz and 14.275 MHz at :30 past the hour unless we're on a gas stop or the lunch break. Give us a call!

Nick N0LP

EOSS GPSL Coordinator

5592. Garmin Tour

Yahoo group: GPSL (2009 — 2010)

From: L. Paul Verhage
Topic: 5081 Message: 5592

I called Garmin and updated them to our visit. They'll be ready, but ask that no more than 60 go. Right now I have 57 registered. I doubled checked with Garmin and it's fine with SABRE also taking the tour. Garmin didn't say anything about bring ID, but I suspect everyon will have it. I forgot to ask about bring cameras. Bring them unless I hear otherwise. They plan to break us into three groups. You'll be able to talk to Garmin engineers.

It will save time if I can send them a list of names. So please reply back with the names of everyone going.
We'll meet at the Pizza Shoppe across the street from Garmin at 11 AM for lunch.

Zack and Crys Clobes

Do you have an address for Garmin and/or the pizza joint? I've been by
their building once before, but it's been a while.

This is for Garmin. The pizza place is across the street to the south (southwest corner of 151st and Ridgeview), somewhere in that shopping area.

Hi Paul,

I think Nick, N0LP, is out of pocket tonight, so I will fill in the EOSS names for you. We will have two less attending the Garmin tour for a total of 14:

Marty Griffin

Sharon Griffin

Nick Hanks

Daryl Hartner

Glenn Hetchler

Edna Hetchler

Chris Krengel

Jim Langsted

Steve Meer

Larry Noble

Mike Pappas

Teresa Pappas

Miles Pappas

Rick von Glahn

All this from Nick's exquisite, detailed GPSL book. Hope this helps. Looking forward to seeing the gang and sniffing some helium...

5600. Weather for this weekend

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-15 04:12:05 UTC
From: Mark Conner
Topic: 5600 Message: 5600

It appears nearly perfect for Kansas in July. Temps the remainder of the week should be in the mid-80s during the day and low-mid 60s at night. Saturday morning might even be in the upper 50s. Surface winds should be light from the north. If the humidity drops as expected and the skies clear, we should get a good inversion Saturday morning to reduce surface winds even more. With relatively dry air aloft, this should yield good conditions for balloon-borne photos/video.

The forecast wind flow for Saturday morning is almost unidirectional from 5000 ft to 50,000 ft, from about 320 degrees. Peak winds will be about 60-70 kts from 30 to 38 kft. This will make the tracks quite long for a July flight - the latest forecast I ran showed a distance of about 70 miles. If we use Mission Valley, this puts the landing about halfway between Iola and Yates Center.

The only wrinkle I see is that this setup is also prone for unforecasted thunderstorm clusters, especially at night and early morning. They would form to the northwest and ride that unidirectional flow SSE. A little ripple in the upper air flow (often not forecast) can be enough to trigger these clusters. At the moment, NWS is thinking it'll be too dry for this to happen - hope that's the case.

If you are using the NSV prediction page, keep in mind that the turn to the west at 60,000 ft will be sharper and farther west than the prediction shows as the models do not show those details well.

I'll be driving down from Omaha Thursday morning - not sure if I'll be at the pizza place by 11, but hopefully before noon.

73 de Mark N9XTN

5601. Mission Valley HS

From: L. Paul Verhage
Topic: 5601 Message: 5601

I called to remind MV HS about the launch today. I was told they signed their contract for resurfacing the parking lot and that it might start by Friday. If so, we'll have to launch from the east side of the school.

I was also told they'll be locking the front gate. So we may have to carry the equipment in.

Perhaps we should be looking at the east side. There should be access to the fields.

Mr Wallio,

I am writing to submit flight information regarding our last balloon flight. I belive that we have set a new altitude record and also may have a number 2 spot on the charts for lightest payload.

Attached is the raw telemetry from the flight (txt) and a slightly polished telemetry record (xls). We will be publishing a full record of the flight in a more readable format later, but I am giving that task to one of our summer interns and it may not be up immediately. The data presented is not in standard NMEA strings but rather the output from the microprocessor we are using for a summer camp with blind students in a couple weeks. The data is pulled (as characters) from the NMEA GPGGA strings, but only one reading (time, alt, long, lat) per second due to limited on board memory. In this manner there may be a couple seconds separating different values, but the data clearly shows that the maximum altitude was at least 128,373ft (note: the log is in meters from the GGA string). Please let me know if you would like a copy of the source code or any other information to validate the information.

5613. BASE 39 Update - float with QSL opportunity for folks in portions of Central U.S.

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-15 22:59:01 UTC
From: BASE
Topic: 5613 Message: 5613

Dear friends,

It appears that we will float BASE 39 on Saturday,18 July. This means that we will carry the 922-28 MHz spread spectrum radio,and will not reach an extremely high altitude.

Launch still will occur at 13:50 UT (8:50 am Central Daylight Time) from Rantoul, IL (40.29 N, 88.14 W) The target ascent rate will be 1000 feet/min.

APRS information will be sent over 144.39 MHz every minute under the call sign, W9YJ-11.

The helium filled balloon will reach a float altitude of 70000 feet (21.5km) about 15:00 UT and will attempt to float at this altitude for about three hours. During this time the balloon should travel slowly to the NW from about 40.0N & 87.8W to 40.1 N & 88.1 W. The descent will begin about 18:00 UT on a slowly deflating balloon with landing about 19:30 UT.

The uplink frequency on the radio will be 144.36 MHz, and the downlink frequency will be 446.025 MHz.

The Scouts will be using the call sign WB9SA. If you have a chance to contact the station, I know the Scouts will be thrilled. You may also attempt to use the repeater for a long distance Earth-Balloon-Earth contact with hams from larger distances. The Scouts will be listening for N9XTN-11 and WB8ELK and from GPSL.

Thanks for your support,

Howard

Harry:

I would recommend a carpool. Did not know that the Garmin factory was so far from the motel.

I just got here at the Quality Inn and wondered when people want to leave from here.

Unfortunately Bill Brown left late and may drive directly to the factory. I will be giving him the directions later tonight.

From: L. Paul Verhage
Topic: 5081 Message: 5619

We will enter Garmin on the north side. Their parking lot has some constuction, there should still be enough space. I'll meet you at the pizza Shoppe on the south side of the intersection. Paul *DIRECTIONS FROM 1-435 SOUTH TO GARMIN INTERNATIONAL:*

1-435 South to 1-35 South (Wichita)

Follow 1-35 South to Olathe Exit 215, also 169 South / 7 South

Go Straight through the 1st Stop Light

Go Left at the 2nd Stop Light

Continue Over the Bridge for Approximately 1 Mile

GARMIN is Located on the Left Side of the Road

Date: 2009-07-16 03:00:47 UTC
From: Mark Conner
Topic: 5620 Message: 5620

I didn't see anything on the e-mail list or the website for when/where BLAST! will be shown, other than it's late afternoon tomorrow somewhere. Any details?

Also, how long is the Garmin tour expected to take?

73 de Mark N9XTN

5621. GPSL weather forecast

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-16 03:38:01 UTC
From: Mark Conner
Topic: 5621 Message: 5621

Saturday looks better and better. Temps will be 55-57F at sunrise, not far from a record low. Afternoon highs will be in the low 80s. Surface winds from the north at less than 5 mph. Skies should be clear and little moisture all the way up, so camera shots should be great.

There is a chance for severe weather in northeast Kansas Thursday late afternoon into evening, but likely to be just marginally severe wind and hail. Skies will clear during the day Friday with highs in the mid 80s.

It appears we may be using Banner Creek for our launch site, given the access issues at Mission Valley. The predictions are pretty stable with the direction of about 155 degrees and a distance of 70-80 miles. From Banner Creek, this puts the landing several miles south of Ottawa (Kansas, not Canada).

Note there is some construction (resurfacing) scheduled on US56 between US75 and US59. It may be easier to come south from Lawrence on US59 to chase rather than risk delays on US56. KSDOT says that the construction should not significantly affect traffic, though.

Garmin said expect around 90 minutes to two hours. The screening for Blast! is at my schoool, Washburn Tech. Doors open at 6 and the screening starts at 7. Bring your own snacks for the movie. You can also do set up Thursday evening.

The perferred parking is the center of the campus. There's multiple ways in.

Hi Bruce:

I wondered if anyone was staying there. I talked with Harry Muller last night and we are going to meet up withthe EOSS group (just woke up as I type this). Give a call on 146.550 (EOSS simplex channel) and we can hook up or pop over to Quality Inn as we are to grab a bite and talk how we are going to get there. We are looking at sometime of meeting up with the group around 10 AM but it is going to take over an hour of hard driving to get there. Anyone hear from Paul?

Bill Brown is in Columbia, MO, looks like he got there around 4 AM this morning. Has anyone mentioned the name of the restaurant we are meeting at prior to the Garmin Tour. Bill may join us there or meet us direct at the factory.

From: Ronald Malinowski, Jr.
Topic: 5627 Message: 5627

I am posting this here cause I think I will get a quicker answer to my question. for testing purposes I want to temporarily be able to digipeat a balloon tracker for testing through my mobile to get it into a local i-Gate. Im new to the TM-D710 and there is an option to digipeat own callsign, I turn this on and it doesn't seem to do it. I thought this would digipeat anything with n9qgs all the way through n9qgs-15.

also this would be something I would like to temporarily activate possibly when I reach a balloon that I know is not getting into an igate so the final position may be obtained via aprs.fi for onlookers. What feature and setting do I need to activate to set my car up as a digipeater in a heartbeat. I believe the tracker is set as wide 2-1 and i don't want to have to change settings on the tracker whic would require me to unsolder the GPS lead to be able to communicate programming data into the tiny-trak. I know there is a resister value that would eliminate this, but I don't recall the value so I have not been able to make this mod.

Any info appreciate, Ron N9QGS

Still looks pretty consistent. Using 1000 ft up/ 1000 ft down, and 90,000 ft burst, the landing looks to be about 8 miles south of Ottawa. The winds I used for this profile were adjusted by the latest sounding data above 60,000 ft.

Surface winds Saturday morning still look to be light from the north at less than 5 mph, temps in the 54-58 range.

Central USA Cross Band Balloon Launch Saturday July 18

---

a.. Subject: [amsat-bb] Central USA Cross Band Balloon Launch Saturday July 18
b.. From: "JoAnne Maenpaa"
c.. Date: Thu, 16 Jul 2009 21:18:34 -0500

Hello everyone,

This is making the e-mail rounds of mid-west ham radio circuits. Working a high altitude balloon launch might be interesting to AMSAT folks in the central portion of USA ...

QSO Opportunity with High Altitude Balloon Flight Saturday,
18 July 2009

As part of SpaceJam-3 (www.spacejamboree.com),
DePauw University (www.depauw.edu/acad/physics/base) will
be flying a cross band repeater to allow the Scouts at the Jamboree
to talk with ground stations from a large area of the central
portion of the United States.

Launch will occur at 13:50 UT (8:50 am Central Daylight Time)
from Rantoul, IL (40.29 N, 88.14 W) The target ascent rate will
be 1000 feet/min.

APRS information will be sent over 144.39 MHz every minute under
the call sign, W9YJ-11.

The helium filled balloon will reach a float altitude of 70000
feet (21.5km) about 15:00 UT and will attempt to float at this
altitude for about three hours. During this time the balloon
should travel slowly to the NW from about 40.0N & 87.8W to 40.1 N
& 88.1 W. The descent will begin about 18:00 UT on a slowly
deflating balloon with landing about 19:30 UT.

The uplink frequency on the radio will be 144.36 MHz, and the
downlink frequency will be 446.025 MHz.

The Scouts will be using the call sign WB9SA. If you have a
chance to contact the station, the Scouts will be thrilled to
make the contact! You may also attempt to use the repeater for
a long distance Earth-Balloon-Earth contact with hams from larger
distances.

Thanks to Howard Brooks, KC9QBN, Professor of Physics & Astronomy
at DePauw University, W9YJ for making this happen!!!

If you are in the IL/IN area you might catch ATV from our first
balloon going up (100,000 ft) at 8:20 AM CDT Saturday from Rantoul
IL 430 Mhz, with a CW call "DE WB9SA"

5631. GPSL launch site change - KATS (in Topeka)

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-17 15:33:23 UTC
From: Mark Conner
Topic: 5631 Message: 5631

Hello from the GPSL 2009 conference!

Zack W0ZC has made some coordination calls with Topeka/Billard and Forbes Field - we are now planning to fly from the KATS (nka Washburn Institude of Technology) parking lot. Exact site will be selected at lunch but it will be within the KATS campus.

Teams are planning to arrive at 0630 CDT (1130 UTC) with launches starting around 0730. We will try to keep the interval between launches to a minimum (hopefully all within 30 mi). Coordination with Forbes Field will occur prior to launch since we are not far off Rwy 31's departure route(Topeka/Billard is not requiring pre-launch coordination, just general awareness - their active runways do not align with KATS).

More later in the day, especially after the wx briefing about 1545 CDT.

73 de Mark N9XTN

5632. GPSL update

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-17 22:28:34 UTC
From: Mark Conner
Topic: 67 Message: 5632
Attachments: 1 described; binary payloads are missing from this source WARC

Launch teams will arrive at KATS beginning around 0630. Our launch window is 0730-0830 CDT (1230-1330 UTC). Those who are ready will probably release at or shortly after 0730 with perhaps a second group 15-30 minutes later.

If the winds remain light, NSTAR will wait to about 0815-0830 to launch. We need to have our balloon filled by about 0745 so the helium tank can be turned by 8 and the custodian can go home (he's coming in just for us and would prefer to get on with his day). This should hopefully give us enough overlap with the BASE flight for a chance at BBE telemetry.

Our landings should be south or southeast of Garrett KS - the nominal profile to 90,000 ft is for about 10 miles SE of Garrett (150 deg at 70 mi). Higher altitudes will end up closer to US 59. There is a repeater listed in Garrett, but someone said it is not currently functional. We will try to use the Mound City 147.285+ repeater for recovery coordination.

Post-recovery rally point is the Pizza Hut in Garrett (North Maple Street, the north side of town on US 59).

73 de Mark N9XTN

5633. ATV cancelled from BASE 38 Launch

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-18 11:22:46 UTC
From: Ron Malinowski, Jr.
Topic: 5633 Message: 5633

Due to technically difficulties the ATV that was scheduled to be on BASE 38 from Rantoul, IL has been removed, and with the change of GPSL launch times, the flight order will be reversed and digital cameras will replace ATV, and will launch at later time, and repeater will fly in the earlier time slot to be closer with the GPSL group.

5635. Quick GPSL update

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-18 19:11:46 UTC
From: Mark Conner
Topic: 5635 Message: 5635

Appears everyone recovered payloads except ARBONET. From overhearing the lunch conversation, they had a battery issue in flight and were not transmitting APRS data clean enough to be decoded. I think an effort is underway by some of the EOSS members to see if they can possibly DF the payload.

NSTAR has photos of at least one other balloon in flight. Our balloon was pretty entangled in our flight train, but did not affect the chute and we only had a few pictures where the balloon remnants obscured the camera view.

WB8ELK's balloon seriously fouled his chute and he more or less streamered in, but no major damage noted (landed in a soybean field).

A get-together will be held tonight at 6pm at the Coyote Cafe (?? - Coyote something or other) to share flight stories and other lies.

73 de Mark N9XTN

5636. Whose balloon is this?

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-18 21:38:38 UTC
From: Mark Conner
Topic: 5636 Message: 5636
Attachments: 1 described; binary payloads are missing from this source WARC

This picture was taken from NSTAR's payload when it was at about 89,700 ft at 38 35.62 N 095 28.08 W (11 miles W of Ottawa) at 1419 UTC. The azimuth to the sun is about 100 degrees at this time, which is aligned roughly with the left edge of the picture. So the azimuth to the other balloon is roughly 140-150 degrees. A WAG for distance would be 2-5 miles, and an altitude in the 91-95 kft range. So the location of the other balloon is 6-9 miles SW or WSW of Ottawa at this time.

I'm going to try to extract what track data I can get from findu.com and see if I can correlate it, but if anyone thinks it's their balloon (or has more track data than me and can tell right away), please let me know.

I think we have a picture of a second balloon, but will have to check further.

OK, I got enough track data to work it out. NSTAR was viewing
W0NSV-11 (Near Space Ventures) at 14:19:23 UTC while NSTAR was at
about 89,700 ft and NSV was at 92,300 ft at a distance of just over 2
miles. Attached is the track map with a blue line indicating the
direction from one balloon to the other at the time of the photo.
This is consistent with the estimates worked out below.

5640. Flight track

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-18 23:03:26 UTC
From: Keith Kaiser
Topic: 5640 Message: 5640

If someone has a good log of the all or at least most of the flights would you please send it to me. I'm also really looking for a good log of the 144.990 groups too.

Thanks.

Date: 2009-07-19 02:03:33 UTC
From: Mark Conner
Topic: 5640 Message: 5641
Attachments: 1 described; binary payloads are missing from this source WARC

Hopefully Yahoo will link to the attached text file. This is all the log data I pulled from FindU. It's incomplete, but gives a good picture of the flights for all but two of the flight trains.

I would encourage each group to post a log contain as complete a record of time/position/altitude as possible. I would like to create a KML file for Google Earth that would show the flights as they were launched so one could see relative positions.

I will have a more complete log for NSTAR in a day or two, once I extract it from the payload and process it.

The dot in the upper left of the photo is the NSV balloon.

Also, the Univ of Minnesota group got *4* balloons in one of their
photos (they were in the first group of 5 that launched).

5646. Hotel Problems

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-19 12:14:21 UTC
From: L. Paul Verhage
Topic: 5646 Message: 5646

Can everyone please send me your hotel complaints? Also lt me know if I can include your name with the complaints.

I'd like to use them for fodder when I make my case with the hotel.

It was a great GPSL and I really enjoyed hosting. I got a little scared there when I saw the balloon grade tag on the tanks.

Overall, how many tanks were used? Can I get an idea of how tanks should still have gas so I can confirm with Linweld what the see?

Anyone with contacts with Raven and CSBF, please email that information so we can start working on GPSL 2010.

I'll get a slideShare account set up for GPSL. So please get your slides and notes togther so we can post them. I'll send out the password to the account privately. It can be shared with anyone, I just don't want to post it publically.

Thanks

I'd like to arrange a tour of Raven during GPSL next year. The plan is to visit Raven on Thursday and hold the conference at CSBF on Friday. The launch would take place at CSBF on Saturday if that's possible.

This would be around the 4th of July, give or take a week or two.

Zack,

That was us that got stuck in the tree. Ron and Tim from Michigan.. that for aiding to the extraction efforts.. It did not seem like it would be that much effort to me.. until we got up there closer then I was looking more and more confused how to tackle it.

Thanks again to everyone for your help.

Just so there are no misunderstanding, I am assuming it is the Aerostar balloon manufacturing plant in Sulpur Springs, TX that you want to visit and if so I will talk to the senior aerospace engineer about GPSL2010 and getting some contacts for CSBF in Palestine TX.

Will get back to you shortly.

Aeronauts,

I've uploaded the flight log broken down by each ballon to the superlaunch.org web page. It's right at the top, if you have any problems let me know.

I can upload some pictures, or anything else you want too, so let me know what you would like to see. Keep in mind this will be our permanent home for the superlaunch.org web site. So keep using http://superlaunch.org for the URL eventually that is the address you will see in the address box.

I discovered my second tracker was KD4STH-8 and not KD4STH-9. Does anyone
data from 144.39? I checked findu and only get 5 records during part of the
descent.

I'd like to see if I can met with someone and check the radiated power and
range.

Mark,

Actually it was the other way around. NSV was on my second balloon's flight string. As a matter of fact Brian Short also had a package on that same string along with my Rino package.

5667. SpaceJam 3 (BASE 38 and 39) flights completed

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-19 23:36:43 UTC
From: BASE
Topic: 5667 Message: 5667

Dear friends,

I've returned to internet access after a great weekend with the Scouts. I'll briefly highlight the two flights.

First, the things that went wrong (which Mike Manes always reminds us will happen).

1) The Amateur Television didn't fly. Zach's CH 59 camera (434 MHz) wasn't a good fit to the receiving equipment. My attempt to build and test my first ATV pod with supporting parts from Brian Walker in the field with less than twelve hours to launch time, failed to pass the preflight test at T minus 6 hrs.

2) The first balloon attached to BASE 39 removed itself from the float valve as the payload string was being raised.

3) The float valve did not work and BASE 39 went to burst altitude (99,300 feet according to the 900 MHz spread spectrum data). This meant that I had two flights descending at the same time!

4) The GPS on APRS radio (N9QGS-11) on BASE 38, gave 2D information for a lot of the flight. We believe the problem was caused by spinning payloads that limited the locking ability of the GPS unit (it performed better previously). Thank goodness for Bill Brown's DominoEx unit, it made the recovery much easier.

Now the good!

Both flights were recovered with minimal problem. BASE 39 landed in a soybean field 21 miles from the launch site. BASE 38 landed just southeast of Catlin, IL in a mowed path next to a drainage ditch in the middle of a corn field 29 miles from the launch site. I will attempt to determine the peak altitude for BASE 38, by using the data from both flights.

The Scouts enjoyed the flights, the workings of the cross band repeater, and the excitement of the three balloon launches (only two with payloads)!

Cross band repeater was in almost continuous use throughout the high altitude portion of the ascent. Contacts covered great distances with one earth balloon earth contact going between Walbridge OH and Mexico MO (470+ miles)

As always, more information to follow on www.depauw.edu/acad/physics/base.

SpaceJam 4 will be on August 6-8,2010 in Rantoul, IL. Hope the GPSL 2010 is on a different weekend.

Thanks for all of your support,
Howard

5670. RE: [GPSL] GPSL Questions

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-20 00:33:54 UTC
From: Doug Loughmiller
Topic: 5652 Message: 5670

Hi Zack,

Sorry I missed your calls last night. I got home a little while ago and saw your question. We were unsuccessful (at least so far) in recovering the payload. We simply didn't have enough data to narrow the search area down and I'm sure the batteries were depleted by the time we headed back to Topeka. Lesson learned for us was to make sure we have a low power beacon on board with an oversized battery so that we know we have at least some RF coming off of the package for an extended period of time. Michael and I are both disappointed that we lost the package but we gain data and learned a lot so it wasn't a total loss.

I want to thank you and the others for you offer to help us search for the package. I am hoping when harvest time comes around that we get a call from someone who has found our package in their corn field.

I lived in Kansas many years ago so I enjoyed traveling the country side again. Michael and I really enjoyed our first GPSL and plan to participate again next year. Thanks for making us feel so welcome.

73,

Doug, W5BL

Hi Howard,

Well, congratulations on achieving mission success, despite Murphy having focussed on BASE instead of GPSL! Many are thankful for that, I assure you. EOSS-144 had its oopsie with an accidentally disconnected BNC on the ATV feedline - probably from just prior to launch. Apparently the safety line intended to prevent the BNC from rotating due to feedline torsion failed to perform its function.

And so perfection once again eludes the two of us, and perhaps others. If flawless flights ever become routine, I'll find a more exciting hobby, like stamp collecting :=}.

Hi Doug,

What a bummer. And another testament to never giving Murphy an even break.

EOSS has learned the value of that backup DF beacon more times than we care to recall, going back to EOSS-1 in 1990 and most recently just last fall, when the primary APRS tracker suffered an xmtr or antenna failure - which we were unable to duplicate on the ground. It was a 0.9 lb totally independent DF beacon with 48+ hrs of battery life that affected our recovery. Cheap insurance.

I did enjoy watching your launch on Bill's BATC video link, and wish you guys great success with flying the parachute on the bottom. Sure makes for a leisurely ascent! But descent could be a lot swifter than expected if the payload falls into the parachute canopy on burst/release. It's happened during PBC even with conventional flight string configurations - even at JPL!

OK, thanks - I had kind of lost track of who was doing what that morning.

Congrats to Paul on another great GPSL, his third (2001, 2002, and now 2009). I'm glad we were able to fly from KATS - that was pretty convenient, and ATC coordination also went smoothly thanks to Zack W0ZC agreeing to some arm-twisting. :)

Enjoyed meeting all of you - see you next time!

Hi Mike,

Thanks for your note. Well, Michael and I are not too bummed as we learned a lot and absolutely enjoyed the GPSL. As you are probably aware, this was our first meeting but it won't be our last. Yes, the parachute on the bottom was a challenge and not well implemented as we planned to but some weight at the very bottom to try to hold it taught but in our haste to get off the ground we managed to fail to but the weight on. You're right it is a slow ascent!

We managed to get a lot of useful data and like I say, we learned a lot.

I particularly enjoyed meeting the folks from your group. And I can't tell all of you how much Michael and I appreciated the offers to help us search for the package once word got back to everyone that we had a problem. I am very impressed with the passion of your team. I mentioned to Marty and others last night at dinner, that I would like to come up and participate in a flight with your group some time so maybe I can arrange a trip up to do that one of these days.

Take care and thanks for the words of advice. We knew better and made several mistakes. This wasn't one of our finest hours but nevertheless, we had fun!

73,

Doug, W5BL

This all just brings back memories of probably the first ohhh,, 15
flights we had?

ALL DFing, GPS units either werent around yet or cost kilobucks, and
weighed a ton.

These flights were the ultimate FOX hunt!

I am amazed we still got every one back. 47 launched and 47 recovered.
yeah!

5679. Re: [GPSL] What was everybody flying at GPSL?

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-20 03:23:15 UTC
From: Mark Conner
Topic: 5648 Message: 5679

NSTAR had four "systems" flying:

Canon PowerShot A560 with CHDK firmware taking pix every 15 seconds
BasicStamp 2p connected to a Garmin GPS-35, Alinco DJ-190, a TinyTrak3
with a modified firmware chip in it, MAX186 ADC, and temp/baro sensors
and EEPROMs for logging (main payload)
TinyTrak3 connected to Yaesu VX-2R and Garmin GPS-18
ADS-SR1 simplex repeater connected to Yaesu VX-1R

Payloads consisted of nylon lunch coolers with foam inserts.

Paul,

Send it to Keith BUT

I want the record set straight. I did not register as HabitatSkyLab and I did not register as NSV -- I registered as Nick Stich K0NMS. I have flown under that name and call for several years.

I fly as an independent person with lots of help from friends chasing and recovering my packages.

From: BASE
Topic: 5667 Message: 5681

Dear Mark,

I'm checking with the other guys that listened more continuously to the cross band repeater. It did fly on the first balloon that launched at 8:30 CDT. Our balloons did overlap very well. At 8:55, our balloon was at 25000 feet ASL and Bill was at 18000 feet ASL. Our combined radio horizon would be 415 miles at that time, just about the Great Circle distance between the two balloons. Our balloon was at 98 kft at 10 AM and Bill was at 75 kft.

The repeater was very busy by the time that I got our second balloon up and packed all of the launch equipment away.

Next time, I will record the cross band transmissions for the whole flight. I'll let everyone know what I learn.

Thanks for asking,
Howard

And I want to add that Nick and Jerome are the best chase team that GPSL has ever seen. They not only recovered their own ballon, then helped with the NSV ballon and then went on and helped with others besides.

All our pictures from GPSL, launch and recovery are at the following link with more coming; http://nearspaceventures.com/gpsl2009/gpsl2009photos/index2.html

Howard and Mark --

Both NSTAR APRS and WB8ELK DominoEX22 were heard on 144.360 with the latter decoded here near Des
Moines for an extended period of time. N9XTN and I had a brief QSO via his NSTAR 446.300 simplex
repeater. I had two separate receivers and antennas (one was my OSCAR station including a Yagi and
mast-mount preamp) listening but I did not hear anything from the BASE-39 repeater downlink on
446.025.

The longest confirmed BASE-39 QSO so far is N8WAC<>NN0L 402mi (northwestern Ohio to eastern Iowa).
I am waiting for QSL e-mail to confirm the N8WAC<>N0UOE (eastern Missouri) QSO, potentially 471mi.

Ralph,

Thanks for your information.

I checked with Ron, N9QGS, and he said that he did not hear any DominoEX 22 from Bill's balloon on the BASE 39 repeater.

We made no attempt to listen for the APRS string from NSTAR on the repeater at our ground station.

Howard

From: Harry M
Topic: 5685 Message: 5685

I would like to thank Paul and everyone that had a hand in getting GPSL09 together. I really enjoyed it and also seeing old friends and meeting new ones.

ORB-25 flight terminated at burst at an altitude of 61,000 feet. On the chase, and when the balloon was about 5,000 feet on descent, I got stopped for speeding by a local sheriff between Ottowa & Princeton on Hwy-59. After a short delay that seemed like an eternity, and no ticket :), We were back on the road. Landing was 4.25 miles east of Hwy-59 (Princeton) on John Brown Rd. in a tree about 20 feet off the ground. We were able to drive to it and make the recovery.

Back at the Pizza Hut in Garnett I discovered that there was 1 sec of video on the Jazz camcorder and that was of the camera being lowered into the capsule. I must have pressed the stop button inadvertantly. There were 50 pics on the still camera and we viewed them, but on returning home, I have found that there are NO pics on the SD card. I have used two undelete programs and the pics are not in the undeleted files. They have just dissapeared!

My next step is to try and find a data recovery program. Does anyone know of a shareware SD card data recovery program?

PICTURES RECOVERED!

Apparently the camera did not save the pics to the SD card as it always does. All 50 pics were in the cameras internal memory.

Hi Harry

That's great news. For future reference, I've had very good luck with Recuva. http://www.recuva.com/download It's a donationware utility. I used it after one flight to recover video from an SD card that had been knocked out of the camera after our parachute streamered.

Thanks also for asking me to help crew on your launch. It was great fun and I learned a few tricks that we can use on our balloons.

Hi

Leigh and I would like to thank Paul and everyone else that helped organize and execute GPSL. We had a ball. It was great to put some faces to the names I see on the list. We learned some new tricks and also found that some of the things we're doing aren't so crazy after all. We're off to Oklahoma this weekend and then back to Saskatoon (where it's actually warmer than it is down here right now).

I'm not sure if we can convince anyone to come down next year but I'll certainly give it a try.

Hi Doug,

Balloonacy certainly provides an abundance of "teachable moments", and you'll experience many more as you continue pursuing this affliction.

And you and Micheal are more than welcome to join us on any of our flights out of CO. But you could probably dredge up 95% of what you could learn from a trip up here by browsing our web site, www.eoss.org. We have stuff up there that goes back nearly 20 years.

You might be able to get past the risk of letting the payload fall into the parachute canopy by adding a small pilot 'chute on a long line attached to the main 'chute apex. This might be enough to force the main 'chute go upright, thus dumping the payload back out where it belongs. Or not ... :=P

I want to thank Zack for helping out at the welcome table.

GPSL wouldn't have been the success it was without people like Mark giving
us the weather/flight report.

Thanks everyone for having a good time.

Why was the chute UNDER the payload?

PICTURES RECOVERED!

Apparently the camera did not save the pics to the SD card as it always does. All 50 pics were in the cameras internal memory.

Go to:

http://www.pcinspector.de/

Download their tool. It's free and has worked fine for me in the past.

Just be sure to not low level format, or write any data to the SD card before doing a recovery. But, somehow, I don't think I need mention that here.

I was going to send along the San Disk Recovery Pro program to you but it is so locked down it isn't funny. Strange, they should be giving that away for FREE. It would make for very happy customers when they lose valuable pix. Oh well, pcinspector is fine.

Subject: [GPSL] GPSL ORB

I would like to thank Paul and everyone that had a hand in getting GPSL09 together. I really enjoyed it and also seeing old friends and meeting new ones.

ORB-25 flight terminated at burst at an altitude of 61,000 feet. On the chase, and when the balloon was about 5,000 feet on descent, I got stopped for speeding by a local sheriff between Ottowa & Princeton on Hwy-59. After a short delay that seemed like an eternity, and no ticket :), We were back on the road. Landing was 4.25 miles east of Hwy-59 (Princeton) on John Brown Rd. in a tree about 20 feet off the ground. We were able to drive to it and make the recovery.

Back at the Pizza Hut in Garnett I discovered that there was 1 sec of video on the Jazz camcorder and that was of the camera being lowered into the capsule. I must have pressed the stop button inadvertantly. There were 50 pics on the still camera and we viewed them, but on returning home, I have found that there are NO pics on the SD card. I have used two undelete programs and the pics are not in the undeleted files. They have just dissapeared!

My next step is to try and find a data recovery program. Does anyone know of a shareware SD card data recovery program?

Hi Joe,

The guys from Maine do that to slow down the ascent rate in order to extend the flight duration and go farther downrange (in the winter). Not sure what ARBONET's goal might have been, but it sure slowed the ascent!

Ummm, Why not just use less lift like we do? Then it will stay slow all
the way up.

I don't have the data but I bet the rate of climb sped up as it got higher.

From: wb8elk@aol.com
Topic: 5652 Message: 5700

Hi Joe,

The main reason for Arbonet's inverted parachute was the fact that their payload inserted directly into the balloon nozzle to measure internal pressure via a PVC pipe that also supported the payload itself. Their intent was to have the parachute bring everything down after inverting itself after burst.

- Bill WB8ELK

Filling light risk having the ascent rate stall out. The parachute drag will affect only a positive ascent rate. But yer right, the constant drag area of the 'chute will yield less and less drag as the atmosphere thins.

Ahhh That makes more sence..

By the way did they get any pressure data?

5703. Re: [GPSL] GPSL Questions

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-21 01:20:12 UTC
From: Joe
Topic: 5652 Message: 5703

Hi Mike,

I just do not know what we are doing differently.. Ya know with all the stuff we do differently and NEVER EVER have had a problem with.

I read about these people that fill with in our flights grazy positive lifts. Like for a 6 pound payload, giving it 8 or even 10 pounds at the nozzle of lift!

We have NEVER EVER gone more than a POUND of extra lift. and thats only on a 20 MPh+ wind at launch days.

Our fills wind up as follows,regardless of payload weight,
25% over 1 pound extra
50% 1 pound extra
40% 8 ounces extra
10% 4 ounces or LESS, one flight had only 1 ounce of positive lift!

And we have NEVER had them stall out, we have had SLOW rates, like 100 to 200 fpm,, but the only one that possibly satalled and we don't really know what happened on that flight because it was the LONG flight. the Ohare Special. As we call it. And that was a winter flight that lasted 12+ hours yet it only traveled from here to Ohare.

Soo strange. Why when we do things soo differently and never have these same problems?

Kinda like the Space Data payloads. There's also vent valve in Space Data's
payload to hold predetermined altitude.

Hi Joe,

We've had a couple of floaters, despite a 1000 fpm fill. Could have been a leaker. One was at the one GPSL that we hosted here in CO. We use Norm Kjome's technique of computing a gross lift (He bubble alone) of 115 to 125% over the gross weight (balloon + neck load). The smaller bags get the larger margin. Generally yields about 1000 fpm average from launch to burst. This helps keep actual vs predicts passed to the FAA before launch in the same ballpark.

Your "OHare Special" was pre-GPS, so you were using baro pressure telemetry for altitude? We did too, and saw plenty of 120K' flights using that data. Of course, that data was wrong and attributable to the 1% FS transducer error when measuring actual pressures of 1% FS :=P.

It would be interesting to include the drag chute to slow the ascent, but to cut it away later in the ascent. That would allow you to collect more data lower in the atmosphere, but still get high enough to burst.

Or better yet, deploy the 'chute after you reach 60,000 feet and cut it away later. That way you could take advantage of changing wind conditions to manipulate your flight path (for instance using the strato turn around to come closer to home).

Technology challeneges are always the best.

5708. RE: [GPSL] GPSL Questions

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-21 02:09:03 UTC
From: Doug Loughmiller
Topic: 5652 Message: 5708

Hi Joe,

We were testing a system that required us to couple our payload directly to the balloon, thus there wasn't any place above the payload to attach the parachute. We were measuring internal pressure of the balloon envelope in flight as we were collecting balloon performance data with the regards to the pressure at the burst point.

73,

Doug, W5BL

Subject: Re: [GPSL] GPSL Questions

Why was the chute UNDER the payload?

Mike Manes wrote:

Hi Doug,

Balloonacy certainly provides an abundance of "teachable moments", and you'll
experience many more as you continue pursuing this affliction.

And you and Micheal are more than welcome to join us on any of our flights out of CO. But you could probably dredge up 95% of what you could learn from
a trip up here by browsing our web site, www.eoss.org. We have stuff up there
that goes back nearly 20 years.

You might be able to get past the risk of letting the payload fall into the parachute canopy by adding a small pilot 'chute on a long line attached to the main 'chute apex. This might be enough to force the main 'chute go upright, thus dumping the payload back out where it belongs. Or not ... :=P

Doug Loughmiller wrote:

Hi Mike,

Thanks for your note. Well, Michael and I are not too bummed as we learned a lot and absolutely enjoyed the GPSL. As you are probably aware, this was our

first meeting but it won't be our last. Yes, the parachute on the bottom was a challenge and not well implemented as we planned to but some weight at the very bottom to try to hold it taught but in our haste to get off the ground we managed to fail to but the weight on. You're right it is a slow ascent!

We managed to get a lot of useful data and like I say, we learned a lot.

I particularly enjoyed meeting the folks from your group. And I can't tell all of you how much Michael and I appreciated the offers to help us search for the package once word got back to everyone that we had a problem. I am very impressed with the passion of your team. I mentioned to Marty and others last night at dinner, that I would like to come up and participate in a flight with your group some time so maybe I can arrange a trip up to do that one of these days.

Take care and thanks for the words of advice. We knew better and made several mistakes. This wasn't one of our finest hours but nevertheless, we had fun!

73,

Doug, W5BL

Hi Doug,

What a bummer. And another testament to never giving Murphy an even break.

EOSS has learned the value of that backup DF beacon more times than we care
to
recall, going back to EOSS-1 in 1990 and most recently just last fall, when the primary APRS tracker suffered an xmtr or antenna failure - which we were unable to duplicate on the ground. It was a 0.9 lb totally independent DF beacon with 48+ hrs of battery life that affected our recovery. Cheap insurance.

I did enjoy watching your launch on Bill's BATC video link, and wish you
guys
great success with flying the parachute on the bottom. Sure makes for a leisurely ascent! But descent could be a lot swifter than expected if the payload falls into the parachute canopy on burst/release. It's happened during PBC even with conventional flight string configurations - even at JPL!

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-21 02:34:01 UTC
From: Nick Hanks
Topic: 599 Message: 5709

EOSS has a video of the first five launches we'll post to our website. We'd like to identify the groups and put that as captions in the video. We know four of the groups. Going clockwise from the welding shop side of the center parking area, they are: EOSS, University of MN, NWTI, and ORB. Who was the fifth group?

True, but you know whats funny, we have noticed with our flights, it
stays within the window of 800 to 1200 fpm, with a wide range of lift
like anywhere from the 8 oz to the 1.5 pounds or even close to 2. The
only time we have has slower rates is when we went WAY low or high have
we been outside of that windopw.

>Your "OHare Special" was pre-GPS, so you were using baro pressure telemetry
>for altitude?
>
That one had no altitude telemetry on it at all. we determined atitude
mainly by who was hearing it, and run the formulas for the radio
horizion. We had lots more interest back then on flights, It was all
soo new to everyone. Hell there were not many flights happebning each
year.. Now it's like at least one every weekend almost! At the peak of
that flight on the 40 meter tracking net there was if I remember
correctly like 60 people listening and sending in reports of signal
strengths as well as beam headings. It was a busy day tracking it that way!

>We did too, and saw plenty of 120K' flights using that data.

From: Mike Manes
Topic: 5652 Message: 5712

The 'chute we flew at GPSL on EOSS-144 was the same one that flew on EOSS-1 in 1990. Cut it away? No way, Jose'! Be more interesting to haul up a ballast bag of pressurized air - free ballast!

5713. Re: [GPSL] GPSL Questions

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-21 03:14:30 UTC
From: Michael Willett
Topic: 5652 Message: 5713

Hi All!

Just joined the group and looked at the emails...

Just as Doug stated, thank you all for offering to help and I sure enjoyed meeting all of you! I am very much looking forward to another GPSL adventure! I was very impressed with all of you and realize there is a lot to be gained from other's experience - like knowing the Copernicus GPS is not all that it is cracked up to be! :)

Regarding the parachute:

Doug and Bill both pointed out that the chute was on the bottom of the payload because we were sampling pressure inside the balloon. We indeed did get sufficient data - enough to design a servo system to help us prevent burst.. We also found the pressure is extremely low, at times not even measurable with the 1psi sensor we used.

In regards to the chute tangling - that would be my fault if it indeed did tangle. There was supposed to be a drogue chute out on the fiberglass antenna rod, and at high speed, it would pull open the main chute. However, I never made up the drogue chute, so we took our chances - not a good option... I should also have added more line between the payload and the chute, it would alleviate the chance of hitting it. 20/20 is always better after sleeping.

Finding the payload:

Tonight I have been working on determining the likely area where we may have landed to help my own curiosity if it is found. Our APRS should run for some time, and it would be nice to see if a local ham would go scout the area or we run up there to take a look again. Two key pieces of information I am missing is regarding two other flights that day. 1) It appears Nicholas M Stich (K0NMS) may also have had a slow rate of ascent, (not due to a parachute? :) since APRS reported 38,269 when crossing I-35, and KD0BGQ was at 81,438 when crossing the same point. Noting Bills' WB8ELK westward landing zone compared to the majority, it would appear that we also would be west of our intended search area near Pittsburg, and considering we probably tangled, we would likely be quite short of Pittsburg - falling nearly straight down, so we may be north west of it. Add into the mix that the ascent was likely an expotential climb rate, we again would be more influenced
by the westerlies at altitude if we can consider a similar initial ascent as K0NMS. My hunch puts us at around Stark, Erie and Shaw.

Is there a way to view the APRS or other position data for the various payloads during the flight, and does anyone know the exact corrdinates where K0NMS landed?

Best Regards!

Or better yet, deploy the 'chute after you reach 60,000 feet and
cut it away later. That way you could take advantage of changing wind
conditions to manipulate your flight path (for instance using the
strato turn around to come closer to home).

Technology challeneges are always the best.

Hmmm - a 1200 latex would be about 24 ft in diameter at 60K', so a 24 ft 'chute would cut the ascent rate about in half. But at launch, it would be a REAL drag, not to mention kinda heavy - and expensive. Better to do a valve & ballast.

Hi Michael,

I've seen data on the gas pressure in a latex balloon, and it's just a few mbar guage, spiking just prior to burst. You could actually get some pretty decent data filling a balloon with air on the ground until it burst, maybe using a water manometer and a shop vac. BTW, Space Data does exactly that to prevent a burst.

Hi Harry,

I used the ASUS EeePC model 900...the model 1000HA has a larger screen
and bigger keypads though....Also, the ACER ASPIRE ONE is a good one to
consider....they've been as low as $239 via Tiger Direct.

I guess the 'chuute would have to be a disposable type. Big dry cleaner
bag?

5723. Re: [GPSL] GPSL Questions

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-21 15:36:11 UTC
From: Mark Garrett
Topic: 5652 Message: 5723

Mike:

Just to not the WB8ELK balloon landed further west and north than anticipated was that the balloon become entangled on the parachute. It landed hard and broke a carbon rod and dislodged the downward pointing camera and the SPOT transmitter. Bill was glad to see that it had not triggered the 911 function on the SPOT.

Maybe Bill can follow up on a post mortum on that unit to report any further damage to SPOT.

Subject: Re: [GPSL] GPSL Questions

Hi All!

Just joined the group and looked at the emails...

Just as Doug stated, thank you all for offering to help and I sure enjoyed meeting all of you! I am very much looking forward to another GPSL adventure! I was very impressed with all of you and realize there is a lot to be gained from other's experience - like knowing the Copernicus GPS is not all that it is cracked up to be! :)

Regarding the parachute:

Doug and Bill both pointed out that the chute was on the bottom of the payload because we were sampling pressure inside the balloon. We indeed did get sufficient data - enough to design a servo system to help us prevent burst. We also found the pressure is extremely low, at times not even measurable with the 1psi sensor we used.

In regards to the chute tangling - that would be my fault if it indeed did tangle. There was supposed to be a drogue chute out on the fiberglass antenna rod, and at high speed, it would pull open the main chute. However, I never made up the drogue chute, so we took our chances - not a good option... I should also have added more line between the payload and the chute, it would alleviate the chance of hitting it. 20/20 is always better after sleeping.

Finding the payload:

Tonight I have been working on determining the likely area where we may have landed to help my own curiosity if it is found. Our APRS should run for some time, and it would be nice to see if a local ham would go scout the area or we run up there to take a look again. Two key pieces of information I am missing is regarding two other flights that day. 1) It appears Nicholas M Stich (K0NMS) may also have had a slow rate of ascent, (not due to a parachute?

:) since APRS reported 38,269 when crossing I-35, and KD0BGQ was at 81,438 when crossing the same point. Noting Bills' WB8ELK westward landing zone compared to the majority, it would appear that we also would be west of our intended search area near Pittsburg, and considering we probably tangled, we would likely be quite short of Pittsburg - falling nearly straight down, so we may be north west of it. Add into the mix that the ascent was likely an expotential climb rate, we again would be more influenced
by the westerlies at altitude if we can consider a similar initial ascent as K0NMS. My hunch puts us at around Stark, Erie and Shaw.

Is there a way to view the APRS or other position data for the various payloads during the flight, and does anyone know the exact corrdinates where K0NMS landed?

Best Regards!

5726. Re: [GPSL] GPSL Questions

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-21 20:51:48 UTC
From: L. Paul Verhage
Topic: 5652 Message: 5726

What about using a cheap plastic bag, but releasing three of the shroud lines to collapse the 'chute (on a four shroud line 'chute) and then reeling it back in?

On Tue, Jul 21, 2009 at 4:39 PM, Mike Manes <mrmanes@...> wrote:

Absolutely,

a Dry cleaning bag would be gone in seconds!

Someone post the url of a balloon burst, the chute has to be pretty sturdy to survive the PBC!

5728. GPSL 2010

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-21 20:54:41 UTC
From: L. Paul Verhage
Topic: 5728 Message: 5728

Thanks to the Texas group, we have a point of contact with NASA.

If we can arrange a tour with Aerostar, then perhaps GPSL 2010 should be four days long.

Proposed Schedule
Wednesday - Tour Aerostar
Thursday - Tour CSBF (get a ride on Tiny Tim?)
Friday - Conference
Saturday - Launch (at the Balloon Base apron?)

--
Onwards and Upwards,
Paul

5729. Re: [GPSL] GPSL 2010

Topic: 5728 Message: 5729

It's a 103 mile, 2:45 drive from Aerostar to CSBF on TX 2-lane blacktop.

From: Joe
Topic: 5652 Message: 5730
Attachments: 6 described; binary payloads are missing from this source WARC

This E-Mail conversation started at first between just Mike and myself,
In the middle of working on this reply, I thought the rest of the group
might like to read this piece of ballooning history.

Mike made a comment about using Air as a ballast system. And I mentioned
to him yup like EarthWinds, and "EarthBreeze"

He then replied with,,

Mike Manes wrote:
Thanks for the memory-jog. Yeah, here's a link re Earthwinds:

http://en.wikipedia.org/wiki/Sky_anchor

But you've got me at "Earthbreeze". Que'?

Mike

So heres is the story of "EarthBreeze"

"EarthBreeze" That was Our flight.

The same years that EarthWinds was trying to go around the world I was
in conversation with,, crap I just went through my records, and I
can't find his name. But he was one of the designers of the earthwinds
balloon system. He was excited to see an amateur group want to try to
use the same technology. So he gave us a lot of the details on how to
calculate how to make it work.

Now when I think of it, yes we have had 47 flights, and as I always
say we have recovered 100%. But thinking now, to be truthfully honest
we did loose one,, but I don't count it as a LOST PAYLOAD, for it was
never intended to be gotten back it was our "Earthbreeze"

It was a balloon system just like EarthWinds, except where EarthWinds
was an active system, ours was a passive system. well kinda,,,

With the help of the EarthWinds designer we calculated what diameter for
the anchor balloon we would need to balance it's size, overall weight of
the whole flight train, and the amount of ballasting it would need to
provide., and what pressure at the cubic feet it had to be able to
cancel out the 15% positive life we were having to put into the balloon,
to make it of course through the loss of sunlight.

We came up with the design and made up the whole system.

Sadly this was all still way before GPS's All we had was a payload that had a CW message that looped over and over. We had when you timed the duration of the loop, the timing of the loop would tell us the altitude. We used as in your release mechanisim a radiosonde pressure bellows unit. But instead of the switch contact area that the wiper arm usually connects with, we replaced it with the resistor part of a slide pot, to make a varing resistor per pressure. The payload looked like this on the outside.

The center RED area was the actual electrinics compartment. The yellow end parts are solid styrofoam blocks for flotation if it would happen to go for a swim.
The view of inside the payload looked like this. Notice the lack of insulation, we thought since little heat if any will be generated, why bother with the added weight. This will eventually come to bite us, how much we just did not know.

I told you this was OLD, we were still at the time of that flight caled WARBA.
The Wisconsin Amateur Radio Balloon Association. WARBA
Final payload design and layout was made by Steve WB9ZRE
The bellows I think came from Bill ELK? not too sure, way too long ago to remember now!
The transmitter was a 50 mw 20 meter OCC can type on 14.31818 as seen above. And if was fed directly into a full sized dipole that came out of the payload top and bottom.

To the left of the "Transmitter" is the brain chip. It was made by someone that Mark KA9SZX knew, it was an awesome chip, I would love to get more of them.

It had a CW message that was programmed into it. and by the value of the resistor on two pins determined the speed the CW was sent at! UTTER simplicity!!!

We just tied that resistor baroswitch modded unit to this chip, and done perfect code.

The message at sea level was agonizing slow, Like 1 WPM or so, the whole message took like 45 seconds to loop through! Slide it to the other end (dead short) and it was too fast to copy! but still sent good code. it sounded like amtor or some auto repeating digital signal, each loop was like 1/2 a second in duration or even less!

At the hopefully designed float altitude of 75,000 feet, we figured that the code the message would take just barely over 1.5 seconds to finish one looping of the message. Beneath is a pair of those S&G Photo Lithium batteries we all used back in those days!

Now onto the balloon system, the upper balloon was a standard kaymont TA 1500, nothing special.

The bottom, was a balloon we were testing from someone else, I don't remember who, but that it was BLUE! I don't remember what the inflated diameter would have been, or what the PSI would have needed to be to create the added ballast needed for long duration flight. Sorry this is just way too long ago, records were lost long ago,, sorry gang.

But we did know for the calculated diameter and final pressure that we needed, we were able to calculate the amount of our locations (close to sea level 1000 feet above sea level) we were able to calculate the amount in cubic feet of this air we needed to put into the balloon, so that it fills and pressurizes the right amount at the right altitude.

Ok we knew how many feet we needed to put into the ballast balloon, but how do you measure how many feet? To the rescue comes Tim K9SB, some lab equipment he was able to borrow, where we just used a simple vacuum cleaner put on blow mode into this device, and this device connected to the ballast balloon. it can be seen here getting started. It looked simple, But according to Tim, the lab said it's very accurate, like .1 of 1% accuracy! WOW!

Now it has the correct amount in it and is being tied off to seal the balloon. Rubber cement was also used to absolutely seal the neck.

The restrictor bag material was made by some company. Who? don't know, It was a raw rip stop nylon, that was incredibly light, it even felt like it was silk, but it was nylon for sure, Yet incredibly strong!

A scrap piece that was less than a 1/4" wide and say four feet long was tied to a rafter, and tied to a loop handle, no fancy streess reducing knots or anything yet this tiny scrap was able to support three of the launch crews weights!

The seams were a special Hot air ballon type of seam, that was suggested by the EarthWinds guys, and we had done for us. Again a scrap piece to test the seam was 1" wide and it supported my weight easily 200+ pounds!

Well we hung this in the rafters and filed the lifting balloon as seen here.

You can see all the extra restrictor bag material hanging along with the small bubble of sea level air in the Blue balloon.
Time for liftoff! It's off the ground at 8 AM.

sadly I do not have an actual picture of the system leaving, but it was in one way beautiful this gossamer bag hanging way below the whole system, but then again it was UGLY that stuff looked like a giant snot hanging below the payload! YUK!

Well we started listening to the beacon, it's working GREAT!! pegging our S meters of course, and many on the HF net on 40 are also hearing it, it's working Great!

We are timing it. hmmm, it seems to be raising faster than expected.. but of course this has more extra lift in it than we have ever used before also, so we thought this must be the reason it's climbing so

fast, close to 2000 feet per min we are calculating by the timing of the message loop.

Hmmm, somethings wrong,, 20 minutes into the flight, and the speed is saying we are near the float altitude point of 75,000 feet already by the speed of the message!

That's impossible! But we hope for the best,

Loop duration 1.5 sec,,

5 min later 1.25 sec,,

5 min later 1 second, and so on and on and on, we are thinking crap the ballast failed and it's climbing way past the designed float altitude.

The code speed is getting crazy!

I'm thinking this thing is getting near the end of that wiper sweep of that home made unit and we should be getting pop soon.

The code is now faster than even a dead short was on the ground. Yet amazingly guys with computers listening say it's still sending the perfect message! And they are timing it with their computers to get the interval now. the interval is like a total of what in milliseconds? Like 200 ms to send the whole message!
It soundes like this signal!
http://det.bi.ehu.es/~jtpjatae/sound/sitora.wav

Well we are all waiting for the tell tale flutter of burst. 1.5 hours into flight, still strong,
2 hours,,,

2 1/2 hours! what is going on here!? it's getting weaker but still strong it's like 20 over,,
Ok past the 3 hour mark, the ballast system must have worked. What altiiude it's at is anyones guess tho.
Now it's been 6 hours after launch
For us it's getting weaker, down to s 5 or so. But either skip people still have it at 10 to 20 over, and people that must be more local to the balloon in Michigan, OH, PA, IN, etc still have it strong!

It is now 10 hours after launch, we have no signal here in Wisconsin. On the net Skip prople still have good signal, as well as many along the east coast. Most of new england is hearing it quite well according to the 40 meter net.

12 hours after launch 8PM, and similar situation, except skip must have gotten LONG no one far away is hearing it anymore. we thought maybe it came down after sundown,, BUT the people calling us on the 40 meter net are far to far apart to have it flying too low or on the ground, people from maine to Virginia were still hearing it quite well. and a payload on the ground this would not happen.

Their beam headings of all the people on the net had it located somewhere in either eastern Maine or New brunswick. At least by all the best guess beam headings.

40 meters is getting tough, propagation on the net is getting hard to hear anyone, we try to go to 75 and it isn't aany better, We hang in there until midnight and last set of beam heading from the people still hearing it get it but now out in the atlantic someplace. We hope for the best for the next day.

Come sunup we check in on the 40 meter net freq,, a few still there, and one guy in maine is still hearing it weak but in there and best signal is at he says 30 to 40 degrees. But the band sucks for him on 20 as well as me here in wisconsin, I hear nothing, or the equivalent of an EME signal at best. if that or wishful imagination.. so we go up top the balloon freq on 20 and start calling asking for people to listen for the signal and try to get the best beam heading. several europeans gave headings that all averaged between 330 and 340 or so,, their best guess. But they were hearing it pretty well, we thought way cool!!! This and the maine guys headings place the balloon near Iceland someplace. if you go by the beam headings.. How trustworthy they are on 20 meters well.....

The day trudges on,, the system has been flying now for 28 hours. it's noon here and I'm having trouble hearing anyone in europe anymore. and the east coast can't hear the payload any more either.

we listen off and on for several more hours hopeing that maybe at local sundown the sifg would pop up, but we never heard anything.

finally sundown here and still no peep,

we listen the next day but hear nothing.

It was never heard from again or has been recovered. How far it got, we will never know. But it sure was a LOT of fun!

5731. GPSL09 ORB Website Update

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-22 01:09:10 UTC
From: Harry M
Topic: 5731 Message: 5731

The ORB website has been updated and has a few pics.
Goto ORB-25 then Postflight.

http://members.cox.net/hhm_74775/orb/

Harry KC5TRB

5732. GPSL 2009

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-22 02:12:26 UTC
From: Mark Huffman
Topic: 4595 Message: 5732

Thanks to Paul and his XYL on the success of GPSL 2009 and of course to all others that helped and participated. Carol and I really enjoyed our 2nd GPSL and are looking forward to 2010. We enjoyed seeing folks from 2008 again and missed those who did not make it this year. For our Canadian friends, we look forward to your return in 2010.

One problem I have that maybe someone can solve.

I have a HP laptop, running windows 7, 64 bit AMD. The problem is that liftwin gives me an error when trying to install. Error says it is not compatiable with my system. Does anyone have any solutions or am I stuck using 2 laptops?

One more note, My jaw has healed nicely and all I can say about the situation is "You can't fix stupid and don't look down a barrel to see if it is loaded!" 73's

Mark (N5OTD) and Carol Huffman

5733. Re: [GPSL] GPSL Questions

Topic: 5652 Message: 5733

Yeah I forgot to add that to the story,

what happens to a resistor when it's 30 below zero?

As Jackie Gleason would say Zoom bang!

5734. Re: [GPSL] GPSL 2009

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-22 03:00:52 UTC
From: Mark Conner
Topic: 4595 Message: 5734

I have a Vista x64 laptop that LiftWin won't run on either. It's OK
on my 32-bit Vista laptop. It's probably an incompatibility with a
64-bit OS and/or CPU - the program is several years old and I think
was built with even older tools.

Hi Mark

I don't have access to Win 7 x64 right now so this is just a guess. I suspect you already have it but if you don't, you'll need the VB runtime DLL, VBRUN300.DLL. I'm not sure is there's any compatibility issues with the x64 operating system or not. Next, try right clicking on liftw-041.exe and select Properties. You should see a Compatibility tab. This allows you to trick older applications into believing that you're running an older version of Windows. Under Compatibility, try choosing Windows 95.

I hope that helps.

Thanks to Paul and his XYL on the success of GPSL 2009 and of course to all others that helped and participated. Carol and I really enjoyed our 2nd GPSL and are looking forward to 2010. We enjoyed seeing folks from 2008 again and missed those who did not make it this year. For our Canadian friends, we look forward to your return in 2010.

One problem I have that maybe someone can solve.

I have a HP laptop, running windows 7, 64 bit AMD. The problem is that liftwin gives me an error when trying to install. Error says it is not compatiable with my system. Does anyone have any solutions or am I stuck using 2 laptops?

One more note, My jaw has healed nicely and all I can say about the situation is "You can't fix stupid and don't look down a barrel to see if it is loaded!" 73's

Hi Joe,

The Earthwinds designer was Tim Lachenmeier who now operates Near Space Corp in Oregon.

I was at most of the Earthwinds launches (and attempted launches). The first one was at the Goodyear blimp hangar in Akron, OH, Richard Branson of Virgin Atlantic was the main sponsor of that flight and talked to me on my dad's 2m radio as I drove in asking about the ham radio experiment....the later ones were at Stead AFB near Reno, Nevada. It took 3 tow trucks to winch the large zero pressure balloon up in place over the 22,000 pound gondola and then winch it up to the full height over the large ballast balloon (made of Spectra fiber I believe).

I also had a payload onboard (designed by myself and Bob Rau N8IYD of Michigan). It was designed to transmit the GPS position every 30 minutes via their HF radio on 10 meters and we had school kids around the world ready to track their progress via this method.....sadly the flights never got very far or stayed up very long....as I recall the last flight was the most successful but they had to come down due to a frozen vent valve on the ballast balloon. One previous attempt crashed into the Sierra Nevada mountains and they rolled down the snow-covered mountain peak in the gondola....I remember telling Barron Hilton (one of the main sponsors of the balloon) that the balloon had crashed just as he was handing out the cigars and champaign to celebrate a "successful" launch. They had a very slow ascent rate and I observed what appeared to be black powder falling from the crew cabin at the edge of the airport....turned out to be loads of lead shot ballast which came pretty close to my rental car as I recall. I also recall the surface temp was -20 F....just try to shot photos with a camera or even stand in one place very long under those conditions, let alone inflate a huge balloon like this. I picked up what appeared to be a steaming hot cup of coffee at the food tent, but it was ice cold, but steaming compared to the outside temp.

I have a number of samples of the Earthwinds top zero pressure balloon envelope....had lots of load tape in it.

I'll try to find some of my photos and will post them.

- Bill WB8ELK

From: Doug Loughmiller
Topic: 5652 Message: 5739

Hi Joe,

We were testing a system that required us to couple our payload directly to the balloon, thus there wasn't any place above the payload to attach the parachute. We were measuring internal pressure of the balloon envelope in flight as we were collecting balloon performance data with the regards to the pressure at the burst point.

73,

Doug, W5BL

Why was the chute UNDER the payload?

Mike Manes wrote:

Hi Doug,

Balloonacy certainly provides an abundance of "teachable moments", and you'll
experience many more as you continue pursuing this affliction.

And you and Micheal are more than welcome to join us on any of our flights out of CO. But you could probably dredge up 95% of what you could learn from
a trip up here by browsing our web site, www.eoss.org. We have stuff up there
that goes back nearly 20 years.

You might be able to get past the risk of letting the payload fall into the parachute canopy by adding a small pilot 'chute on a long line attached to the main 'chute apex. This might be enough to force the main 'chute go upright, thus dumping the payload back out where it belongs. Or not ... :=P

73 de Mike W5VSI

Doug Loughmiller wrote:

Hi Mike,

Thanks for your note. Well, Michael and I are not too bummed as we learned a lot and absolutely enjoyed the GPSL. As you are probably aware, this was our

first meeting but it won't be our last. Yes, the parachute on the bottom was a challenge and not well implemented as we planned to but some weight at the very bottom to try to hold it taught but in our haste to get off the ground we managed to fail to but the weight on. You're right it is a slow ascent!

We managed to get a lot of useful data and like I say, we learned a lot.

I particularly enjoyed meeting the folks from your group. And I can't tell all of you how much Michael and I appreciated the offers to help us search for the package once word got back to everyone that we had a problem. I am very impressed with the passion of your team. I mentioned to Marty and others last night at dinner, that I would like to come up and participate in a flight with your group some time so maybe I can arrange a trip up to do that one of these days.

Take care and thanks for the words of advice. We knew better and made several mistakes. This wasn't one of our finest hours but nevertheless, we had fun!

73,

Doug, W5BL

Hi Doug,

What a bummer. And another testament to never giving Murphy an even break.

EOSS has learned the value of that backup DF beacon more times than we care
to
recall, going back to EOSS-1 in 1990 and most recently just last fall, when the primary APRS tracker suffered an xmtr or antenna failure - which we were unable to duplicate on the ground. It was a 0.9 lb totally independent DF beacon with 48+ hrs of battery life that affected our recovery. Cheap insurance.

I did enjoy watching your launch on Bill's BATC video link, and wish you
guys
great success with flying the parachute on the bottom. Sure makes for a leisurely ascent! But descent could be a lot swifter than expected if the payload falls into the parachute canopy on burst/release. It's happened during PBC even with conventional flight string configurations - even at JPL!

73 de Mike W5VSI
CTO EOSS

Doug Loughmiller wrote:

Hi Zack,

Sorry I missed your calls last night. I got home a little while ago and saw your question. We were unsuccessful (at least so far) in recovering the payload. We simply didn't have enough data to narrow the search area down and I'm sure the batteries were depleted by the time we headed back to Topeka. Lesson learned for us was to make sure we have a low power beacon on board with an oversized battery so that we know we have at least some RF coming off of the package for an extended period of time. Michael and I are both disappointed that we lost the package but we gain data and learned a lot so it wasn't a total loss.

I want to thank you and the others for you offer to help us search for the package. I am hoping when harvest time comes around that we get a call from someone who has found our package in their corn field.

I lived in Kansas many years ago so I enjoyed traveling the country side again. Michael and I really enjoyed our first GPSL and plan to participate again next year. Thanks for making us feel so welcome.

Pretty cool,

I wonder if that spec sheet she gave out was similar to the same one I had here. Lots of cool data as well as images. Then I got a bunch of stuff that was like school related from them. Like a big poster, and a bunch of like worksheets to do like tracking on it with or something. Wow the mind is getting foggy!

Joe:

You mean this Id'er from Monticellow Micro:

http://www.monticellomicro.com/ider.html

The Id'er is the smaller of the two boards.
From what I have been told Steve does not have the program to encode the chip however you can bug him if you like at the address at the bottom of the page. I would love to have a few more of these Id'ers as well so if he hears from others he may start looking into writing a new program or generating a new chip. Nice thing was these Id'ers only consumed 3 ma to operate.

Mark Garrett, KA9SZX

I told you this was OLD, we were still at the time of that flight caled WARBA.
The Wisconsin Amateur Radio Balloon Association. WARBA
Final payload design and layout was made by Steve WB9ZRE
The bellows I think came from Bill ELK? not too sure, way too long ago to remember now!
The transmitter was a 50 mw 20 meter OCC can type on 14.31818 as seen above. And if was fed directly into a full sized dipole that came out of the payload top and bottom.

To the left of the "Transmitter" is the brain chip. It was made by someone that Mark KA9SZX knew, it was an awesome chip, I would love to get more of them.

It had a CW message that was programmed into it. and by the value of the resistor on two pins determined the speed the CW was sent at! UTTER simplicity!!!

We just tied that resistor baroswitch modded unit to this chip, and done perfect code.

The message at sea level was agonizing slow, Like 1 WPM or so, the whole message took like 45 seconds to loop through! Slide it to the other end (dead short) and it was too fast to copy! but still sent good code. it sounded like amtor or some auto repeating digital signal, each loop was like 1/2 a second in duration or even less!

I'm not too sure what is what, below is a closeup of the board.

I see the clock ossc tranny, 1 diode, 2 disc caps and 3 transistors,
then there are the two 8 legged chips,
One with the label, and one that might say,,,555? might it be just a
type of 555 timer?

Hi Joe,

? Yes, that's a TLC555 timer. The bellows I sent you for this project was from an old VIZ radiosonde. The bellows in it's original form?had over 150 contacts on?it for each barometric pressure increment...I once?designed a PROM circuit?programmed to increment the morse code output to correspond with the bellows switch number....I flew it on one of Norm Kjome's zero pressure balloons from Univ of Wyoming and it corresponded to his data very well until after cutdown. I have quite a few Xilinx 17128 and 17256 chips (the big brother of the ones used for the monticellomicro ID....at this point I don't see the advantage of using them (and the 555 timer) compared to a low-cost microcontroller and no way to do A/D telemetry other than varying the code speed...but in it's day it was a cheap alternative.?It wouldn't take too much effort to program in a CW message in these chips and I do have the programmer for them at work....I may put one together just for fun.

? I also remember tracking your Earth Breeze balloon as it traveled across the midwest and east coast.....boy, was it fast CW....sounded like a cricket as I recall.

73s de Bill WB8ELK

You should be able to go to the "archived meteorology" page instead of
the "current meterology" page on the same web site to get the date you
want.

Also, you can get the TOP sounding for that morning, which should be
an even better representation of the winds that morning.

I've got a copy from Friday afternoon. I think Mark said that they're archived somewhere on the web too.

However, it seems like it would make more since to extrapolate the soundings from our actual flights.

Yeah, Now days there are more likely many chips that can do more. Thats for sure! But man in it;'s day, this was what 1992 or so? maybe as soon as 90?

I remember I lost the farm in 93 and it was a few years before that,

And fast wasn't the word for it. I was amazed that that clock ossc could turn on and off that fast! and maake cirp free CW too!

LiftWin was written in VBasic V3.0 under W98 or W2K, and requires a VB runtime file, VBRUN300.dll; mine's dated 5/1993, V3.0.5.38.

Might see if loading a newer VBRUNxxx.dll might do the trick.

Does anyone have the original source code for WinLift? I'd be happy to migrate it to .NET if the original author (not even sure who that was) isn't interested.

Hi Joe,

You could roll your own IDer with a $4 PIXAXE08 8-pin DIP. I has 2 10-bit ADC's and 4 IO pins. Runs on +3 to +6 Vdc with internal 4 MHz clock at a few ma Icc. I use one to run the SamCam2 servo, including snap detection using a CdS cell looking at the status LEDs on the Canon 570IS plus a pair of reed switches for drum position detection. Programs in Basic via on-chip serial port using freebie dev sys.

LiftWin is Hank Riley's balloon fill app. Select balloon make & model,
fill gas (He or H2), launch alt & temp, neck load. It calculates neck
lift and ascent rate and burst alt for a preselected range of balloon fill
diameters.

Real handy. I've found that it does fill a tad heavy for 1000 fpm, so
I use Norm's 115 to 125% gross lift - a couple of tenth's of a foot diameter
smaller. There's a link on the eoss web site.

Hi Mark,

Which of the archived datasets most closely resembles the actual GFS
data since there is no archived listing for the GFS model.

If this is a 64 vs 32 bit problem, Win7 Pro and enterprise and Ultimate will be equipped with a Windows Xp compatability mode that creates a full XP OS in a virtual machine. I haven't checked out if this is available to RC copies but, I believe the RC is an Ultimate copy so, ...

First check this page and download and run Securable unless you are ABSOLUTELY sure your processor has hardware virtualization capability. There are a surprising number of current chips that do NOT.

http://www.grc.com/securable.htm

Then, assuming your CPU is VM capable, go here:

http://www.microsoft.com/windows/virtual-pc/download.aspx

and download the XP Mode VM to install into Win7.

Probablilty of Liftwin running in this environment ... SWAG 99.9%. But a VM is going to appear to Liftwin as a 32 bit OS.

Actually, I don't do this cause I'm coming from it from the other direction. I have a Mac and virtualize all my Windows machines. So, I'm not going to run a virtual Win7 and they try and run a 2 deep virtual machine inside Win7 to run XP Mode. Actually, wouldn't work since the virtualized Win7 is running on a "virtual" chip. Or at least I think that is how things would look to a 2 deep VM manager. So, ... good luck. But, should work ok.

Joe:

I had the beta version of this ID'er. Designed by Steve Look (to fit in model rockets) I placed it in my 10 meter beacon and it ran 24/7 for 15 years when I moved and the message was no longer valid. When Steve informed me that he could no longer program a new chip up I went with a Freakin Beacon.   It was designed and operational in Nov 91 and I placed the beacon on the air in Jan 92.   Steve had a lot of Canadian users of this ID'er.

Yeah, Now days there are more likely many chips that can do more. Thats for sure! But man in it;'s day, this was what 1992 or so? maybe as soon as 90?

I remember I lost the farm in 93 and it was a few years before that,

And fast wasn't the word for it. I was amazed that that clock ossc could turn on and off that fast! and maake cirp free CW too!

Hi Joe,
>
> Yes, that's a TLC555 timer. The bellows I sent you for this project was from an old VIZ radiosonde. The bellows in it's original form had over 150 contacts on it for each barometric pressure increment...I once designed a PROM circuit programmed to increment the morse code output to correspond with the bellows switch number....I flew it on one of Norm Kjome's zero pressure balloons from Univ of Wyoming and it corresponded to his data very well until after cutdown. I have quite a few Xilinx 17128 and 17256 chips (the big brother of the ones used for the monticellomicro ID....at this point I don't see the advantage of using them (and the 555 timer) compared to a low-cost microcontroller and no way to do A/D telemetry other than varying the code speed...but in it's day it was a cheap alternative. It wouldn't take too much effort to program in a CW message in these chips and I do have the programmer for them at work....I may put one together just
for! ! fun.
>
> I also remember tracking your Earth Breeze balloon as it traveled across the midwest and east coast.....boy, was it fast CW....sounded like a cricket as I recall.

5760. Re: [GPSL] GFS data for GPSL 2009?

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-24 02:45:49 UTC
From: Mark Conner
Topic: 5744 Message: 5760

GDAS should closely match the GFS initial conditions - GDAS is the
analysis scheme used to initialize the GFS.

You might also pull data for the NAM or EDAS and look for differences.
Mostly they'll show up in the boundary layer, not at altitude, and
the boundary layer winds have little effect on the track. GDAS is a
coarser grid, but has more observation data to work with.

5779. Backup Beeper Hack

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-25 02:36:14 UTC
From: Harry M
Topic: 5779 Message: 5779

FYI

Most of us at GPSL heard the NWTI audio beeper used as an aid in recovery. That was an automotive backup beeper from a local car parts store. I hacked one today and it has two basic components. A TC4069UBP hex inverter and one transistor. The transistor is labeled 468 7H 4. I have no idea what is is. There are a few resistors, a couple caps and a sealed coil (maybe a choke) about a 1/2" in diameter on the pcb. I did not take the time to draw the circuit. I shortened the case by 1" and sealed it back together. I have not noticed any change in volume or pitch so it seems that the case has nothing to do with the resonance.

If you are going to take one apart I suggest you cut around the circumference about halfway from front to rear and about an 1/8" behind a ridge at that point. When it comes apart in two you will have two wires running from the piezo half to the back half that has the pcb hot glued to the inside. A hair dryer will soften the glue on the pcb loosening it from the case. The power wires are glued at the rear and a small punch will loosen them for extraction along with the pcb. I put the pcb into the front half against the rear of the piezo. I cut off the back of the rear case half about 1/8" from the rear. I pulled the power wires through the original hole and glued the front and rear pices back together.

I guess a cool list of groups would be an awesome file or list or whatever to have?

I know ralph has a list on his pages, does ralph or anyone know how up to date it is?

I'll try to get the number of the one we use.

It is pretty low current, and is so loud, it's crazy! it actually comes with a warning not to use without hearing protection.

It is for an alarm in a high noise industrial enviroment where ambient noise is already above like 120 decibles.

We have had liftoff and have heard this thing up to ten minutes later!

On the ground chase teams have heard it more than a mile away.

I recall a tale of ARHAB yore where a payload with a Sonalert beeper landed in
in Amish farm field. The farmer's plow horse got so spooked by the noise
that the farmer hauled it off and stowed it in his barn. Fortunately, there
was also a DF beacon that led the trackers to a successful recovery.

Moral: the "R" in ARHAB stands for Radio.

From: L. Paul Verhage
Topic: 5783 Message: 5783

I was looking over the video from my upward looking camera. By getting the time from launch to burst from the downward video camera, I realize the upward camera stopped just short of balloon burst. The memory card was only half full and temperatures were increasing at that time in the mission.

I wonder if the camera shut itself off at the shock of balloon burst. If so, why didn't the SD card contain the first moments of the burst?

Is it possible the image is written to RAM memory as it is recorded and then copied to the SD card in blocks. If so, then the camera may have been shut off before the image in RAM could be written. Does this make sense?
I'll try recording the face of a clock. Then I can experiment with shuttin off the camera normally and by shaking.

From: Joe
Topic: 5779 Message: 5784

That was one of ours.

It had a small Radio shack Beeper on it. Not the super LOUD version.

Thing is it was worse than this, Again B 4 the days of GPS units all
RDF for recoveries.

The payload was down and chase teams converging on the area from all
the beam headings. Then the signal just dissappeared! NO RF at all,
no beeper at all, Nothing to hunt after! we all thought something had
happened, but what?

We knew the area it should have been in to withinn say a square mile or
so, so kept driving around and periodically stopping to listen very
closely for a signal.

After about 2 hours we were going crazy, and were at this one intere
section looking for a signal when an Amish buggy was going by looking
funny at us, with our antennas and all. They passed right by, then
stopped, and a middle aged man jumped out and came back and asked us
what we were doing here. We told him and a smile came across his face.
He peobably had no idea we thought of what we were talking about, but
then he says I know where your shiny box is,, It is is my Uncles shed.
and said follow him.

5 min later we are going up a long dirt driveway heading obviously to an
amish farm and he opened the METAL shed door and there was out box.

anyenna laying on the ground, and inside this metal building.

He said he was out in the neighboring field whe this thing came
floating down from the sky making a horrible noise that scared his
horse nearly to crazynes, he understoon a 9 volt battery so un plugged
the beeper, and then took it to the shed for safe keeping, hence the
loss of signl, antenna on the ground and in a metal building.\
We thanked him and he wouldn't accvept a reward payment, but he did take
a nice picture we had from previous flight at altitude, He thought it
was beautiful and accepted that.

Ok Mike, the backup alarm is an oscillator, just no antenna. It is radiating "some" rf, so does it not qualify then as the "R" in ARHAB? ;)

NahNah!

Hmmm ... OK. so the farmer also shut your DF beacon off? If he hadn't, you'd probably still heard a signal, since the door seams on metal sheds have large enough gaps to serve as slot antennas. They're not Lindgren EMC enclosures, but they will produce a good bit of attenuation.

Try it.

Hi Paul

We had the same problem with one of our flights where the payload came down so hard it knocked the SD cards right out of the cameras. This caused the video file to be improperly closed. I had to use an SD file recovery utility to rebuild the video file. Even with this I wasn't able to recover the last seconds. I suspect that this is because the data is normally written to the SD cards in 512k blocks. If something happens during that process, I imagine that block would be lost or corrupted.

There was a thread from a few days ago discussing people's favourite SD recovery utilities.

I was acvyually surprised, we did not hear a signal from the road, we
drove past that farm several times, and never heard a peep.

But it was still transmitting when we got it from him.

5792. Solar Balloons

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-26 16:10:18 UTC
From: Keith Kaiser
Topic: 5792 Message: 5792

That was fun!

Deb and I were walking through one of those little neighborhood stores yesterday and we found a solar balloon. Packaged as "UFO Solar Balloon" 'Powered by the Sun!' we had to check it out, so a couple dollars later we found ourselves in it's position.

This morning we took it out of the box. It turns out to be not much more than a ten foot long tube made of a thin plastic like a garbage bag. The instructions say to tie off one end, fill it with air by running with it, then tie off and attache the provided line to the other end.

There was just enough breeze that I didn't have to run (yes!) to fill it, I tied it off and ..... well I can't exactly say it lifted off. It did float around the front yard a bit, sometimes as much as 20 maybe 30 feet off the ground. Mostly it laid on the grass or hovered about 3 inches above it and blew around in the light breeze.

We can see why the guys who launch these for high altitude use must have monster size balloons. This one about 10 feet long by 2 feet in diameter could not even lift the nylon line it was tied to. The sun was hot and the humidity not too bad (for Kansas City) both of which are factors in the lift you'll get. We're going to try throwing some tempra paint inside of it and give it another try on the next still warm morning. We'll keep you posted on our success.

It was fun! Of course the neighbors thought we had lost our minds.YMMV...LOL

I remember wind being a huge factor also, if there is a breeze it cools the balloon of quickly..

I wonder if too if you had it tied too tight not to be able to vent some so the gas can exppand and get less dense.

Was almost no wind to speak off, we also took it to the back where there was none at all. We didn't fill it tight with air, figuring that would not work either so we don't think but can't rule out these factors. At this point there are a few puncture holes in it too because of the grass and gravel in the street. LOL

5795. ARBONET PAYLOAD FOUND!

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-26 16:43:30 UTC
From: Michael Willett
Topic: 5744 Message: 5795

I have not talked to the person who found the payload yet, but I received a voice message on my phone last night that the payload was found just North of Redfield, KS.

This track took us right over the top of Garnett, along the same track as the majority of other balloons, which surprised me, since we no doubt had a strange ascent profile with the 'chute deployed and in tow. I will be calling them later today and making arrangements for shipping here, or I will pick it up in the next few weeks myself when headed for Michigan.

I am looking forward to seeing the payload!

Great news! The ultimate backup recovery method is an address and phone #
on the side of the payload. :)

Try and get the actual lat/long of where it landed. Would be
interesting to see on a map.

People in Kansas are Great!

I just called and talked to the people that found the payload, and they were just the nicest people you would want to talk to. Hoping it did not land on the hood of their new car, I had to ask where it landed... :) Whew! It landed in a cow pasture near their home. They are sending the payload via UPS to me on Monday, turns out they ship a lot of things and were happy to do so. I will get their address in the shipment and will post the more exact location data of the find when I get it. The payload enclosure was broken up, but they said most of the electronics and such were in tact and the parachute was there.

I agree with a previous posting - when all else fails, the telephone number and other information on the payload as a backup is a great thing to have on the payload!

5800. solar balloons

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-26 19:22:20 UTC
From: kmcaviezel@yahoo.com
Topic: 5800 Message: 5800

I use a 24'/side black plastic solar tetrahedral balloon ('tetroon') for solar flights. The last flight was about 400 miles, and over 13 hours, floating between 50k feet and 55k feet. Payload was 5.5 pounds, including 1.5 pounds of jettisonable sand ballast.

Pros:
no helium expense
no helium bottle delivery/pickup hassles.
very cool slow ascent
stable float and damage-tolerant.

Cons:
Definitely more tricky to launch than a latex balloon
Altitude is limited by balloon skin melting.

Launch video of the last solar tetroon is on youtube, same usename 'kmcaviezel'

- Mark Caviezel ng0x, "ES-OS" Experimental Sub-Orbital Society, now in the eastern USA. Two #1 ARHAB records in eight flights. We specialize in zero pressure, heavy lift, and long endurance flights.

After showing BLAST! at GPSL Daryl at EOSS asked if it would be possible to barrow the film to show to other EOSS members. I checked with the producers and they have agreed to allow us to show the film to other GPSL groups. They only request that I keep track of who/when and how many get to see it and feed this information back to them.

So if you are interested in borrowing this very interesting and relevant film let me know. I'll mail it out to you on a first showing basis. You can mail it back or I'll give you the address of the next in line.

Send me a note off-line to the GPSL list so that I can figure out who gets it when.

5806. RE: [Balloon_Sked] NE Illinois Balloon Tracks

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-27 14:53:25 UTC
From: BASE
Topic: 5806 Message: 5806

Dear Ken,

We, BASE at DePauw, use the 144.39 MHz APRS as part of our educational outreach. It is the simplest way to allow our school student partners to follow our flights via the Internet. Generally, we transmit every two minutes and use WIDE 2-1 with the MicroTrak 300. The APRS beacon would only be used for recovery if our primary 900 MHz spread spectrum telemetry system fails. If we could get the support of the amateur radio community like EOSS has developed in eastern Colorado, we would be willing to move to 144.34 MHz.

Please remember that the APRS usage tracks posted by Mr. Deffenbaugh include some stations that receive only one transmission from the balloon. On typical flights from west central Indiana, our transmitter hits stations in central Indiana with an occasional reception by a distant station. After 39 flights, we have never received any complaints of overusing the APRS Network.

We try to be good citizens in the amateur radio community.

Howard Brooks, KC9QBN
DePauw University, W9YJ

I think it would be better to say: "See the distruption this causes?"

Use NOPATH for balloons or put them on 144.34 and away from the aprs

network.

Not sure why anyone would want a balloon on 144.39, with all the traffic

interfering with tracking and recovery.

We retreived plenty of packages without any GPS data to guide us.

Ken, N0ITL

You might give Spherachutes a try.

http://spherachutes.com/

You can use the chart for "rocket weight" on their website to determine the size of the chute.
They'll also sew an attachment point in the spill hole upon request for attaching the load line from your balloon.

Hi Ron,

I also use Spherachutes......and as Roger mentioned, make sure you specify it's for balloons so they stitch the shroud line over the hole to attach the balloon to.

Congrats on the successful use of the "backup recovery system" that you penned onto the side of the payload.

I haven't finished modding Balloon Track to do an inverted parachute ascent, but my wild guess I emailed you a few days ago at least was the same latitude...I had that estimate about 18 miles due west of the actual touchdown. It'll be fascinating to see if I can model that flight with the ascent rate mod now that I know where it actually came down.

What size balloon were your using?

3rd nod for Spherachutes.

Tell them your into high-altitude ballooning so they'll sew a line in the spill hole and you can attach the balloon to that. They're quite familiar with ARHAB requests and we apparently give them a lot of good business.

For 21 flights I have used a 36" Spherachute with a 3" hole in the top and had them sew in two crossed lines over the hole to attach the balloon line to. This has worked for me for up to 4 pound loads. It has been drug out of many trees and I have not seen it damaged at all.

Note that Spherachute sizes their 'chutes by the subtended arc rather
than by skirt diameter. EOSS has never used a 'chute smaller than
5 ft skirt diameter, which translates to a 96 inch Spherachute. A
larger 'chute will simply reduce your terminal descent rate, and will
work fine for up to 15 lb if future needs arise.

5818. Possibled balloon-suitable GPS module at SparkFun

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-28 04:17:01 UTC
From: Mark Conner
Topic: 5818 Message: 5818

http://www.sparkfun.com/commerce/product_info.php?products_id=9171

The data sheet for the GPS module explicitly says the altitude/speed limits are implemented such that one or the other may be exceeded but not both. Power consumption 3.3V at 28 mA. I have not fully perused all the datasheets, but looks like it can do its own logging. It probably can be powered up and left to do its own logging on a flight to see if it really works >18 km. Price is $60.

Operational Limits Altitude < 18,000m*1 or
Velocity < 515m/s*1

*1: COCOM limit, either may be exceeded but not both

I use the ring to prevent some twisting, but primarily to prevent the sides of the airframe from being crushed or broken by snapping shroud lines. I make my shroud lines as long as the circumfernce of the canopy.

My book has a chapter on recovery systems. There's a line to it at nearsys.com, under Publications.

From: Jeff Dailey
Topic: 5822 Message: 5822

Taylor University will launch 12 balloons on july 29 at 4:00pm.

Universities from across the United States will attend a high-altitude balloon workshop at Taylor University on July 29 and 30.

Universities
Missouri University of Science & Technology, MO
Ohio State University, OH
Carthage College, WI
Norfolk State University, VA
Temple University, PA
University of Evansville, IN
Gannon University, PA
Messiah Collage, PA
Geneva Collage, PA
Trevecca Nazarene University, TN
Oklahoma Christian University, OK
Southern Wesleyan University, SC
Penn State University, PA
University of Pennsylvania, PA
University of Cinicinnati, OH
University of Minnesota, Morris, MN
Walla Walla Community Collage, WA
West Virginia University Institute of Tech, WV

The workshop is funded through a Course Curriculum and Lab Improvement (CCLI) Grant from the National Science Foundation (NSF). During the two-day event, professors from the visiting universities will learn of the program from Taylor personnel so they can implement one of their own on their home campuses. They will also build science experiments for launch on a high-altitude balloon.
The launch will occur between 4-5 p.m., Wednesday the 29th.

Flight#190 CCLI Team1 APRS 144.39 KB9ZNZ-1
Flight#191 CCLI Team2 APRS 144.39 KB9ZNZ-3

I own one of the receiver-only versions of these (http://www.sparkfun.com/commerce/product_info.php?products_id=9133), and, while I haven't yet had a chance to hook it to a balloon, the high-density position data (10Hz capable!) is very interesting... with the mag mount antenna (http://www.sparkfun.com/commerce/product_info.php?products_id=464), I achieved 3D DGPS from a cold start in about 20 seconds in the middle of my home. I'm looking forward to hearing how it performs at altitude!

Hi Howard,

It doesn't take many I-gate stations to cover a balloon flight fully, in EOSS's experience. And several of our "regulars" also participate on site with launch, tracking and recovery - they just tune their APRS stations to 144.34 before leaving home.

We do occupy 144.34 pretty heavily, however, since many of our flights have two balloons in flight simultaneously, and both are configured to digipeat each other as well as the beacons from the tracking teams. This provides a pretty nice picture of the entire flight - and the fact that the 1st balloon's landing site gets digi'ed by the 2nd balloon makes for a snappy recovery.

Our COA (waiver) with the FAA also >requires< that we provide up-to-date balloon positions via the internet, so it's important that we avoid having our beacons being "stepped on" by any of the multitude of APRS stations on .39.

Although avoidance of excessive traffic in both directions was a primary rationale for moving off .39, the foregoing has proven to provide plenty of added benefits as well. And it doesn't require extensive support by the larger ham community - just a few reliable stations. We typically get 3 to 5 I-gates lined up for every flight.

That's a "spreader ring", and its purpose is to ensure rapid and reliable opening of the parachute canopy on initial descent. EOSS's are placed about 1/3 of the way up from the riser to the skirt, and have a diameter that's made to allow the shroud lines to take up tension without having to bend around the ring.

Ours are made from about 1/4 inch diameter wicker, but other folks have used embroidery hoops, if one can find one big enough. And I've been looking into bulk fiberglass and carbon fiber tubing that can be bent to the required radius without breaking - no luck so far, but 0.15 - 0.20" OD x 0.020-0.025" wall carbon fiber looks workable.

One caveat: adding a spreader ring does convey the risk of the parachute becoming "Rubik'ed" - where the canopy gets passed thru the shroud lines or the spreader ring due to mishandling. It can be a real quiz figuring out how to undo this damage, and I've even had to resort to complete disassembly of the shroud lines to "de_Rubik" a mishandled 'chute. We use bread ties to strap down the shroud lines one both sides of the ring and up to the canopy skirt to prevent this problem during transport and storage. A better scheme might be to provide a means to quickly detach and reattach the ring from the lines in the proper positions.

Check craft stores etc. That is also what we use here are embroidery
hoops. In the bigger craft stores we have seen them as large as 48" in
diameter!

We have done this by accident also! too many times to remember, or i
should say I'd rather forget. It's is as described Rubik cube effect.
if you dont have the exact return path it to to get in the shape it is,
they you may as well cut them all and start over. That is what we
usually do. times it has been faster and a LOT less frustrating!

I use split rings at NearSys. Those are the rings used for key rings. The one inch diameter ones are plenty strong and impossible to accidentally open. It takes a lot of force to unwrap them enough to open and I've only seen it happen once in 74 flights.

From: Mark Conner
Topic: 5820 Message: 5831

We use a wire wreath ring for our spreader, about 12" in diameter. I don't know that the dimensions for the shroud lines relative to diameter of the chute are all that critical, other than avoiding extremes either way. My chute is roughly 5' in diameter and the shroud lines are about 8 feet from chute skirt to ring. This length was somewhat arbitrary - I had a bit over 8' of line available. I haven't had one foul yet due to the spreader ring not working. Actually, a pretty messed up chute can be functional 'enough'.

Avoid plastic rings due to brittleness in the cold. Wood embroidery hoops seem plenty strong.

Hi Joe,

The biggest embroidery hoop I could find at Hobby Lobby was about 12" D.
Our 10 ft 'chutes need 36" diameter rings.

Gonna keep looking for flexible carbon fiber, though. Should save some
weight and hold its circular form a bit better during ascent.

I forgot to mention that we stow the bread ties (actually green plastic wire
ties intended for agrarian use) on the spreader ring after laying out the
'chute at the launch site. This makes 'em available for the recovery crew to
use before the trip back home.

I think seeing the production process at Aerostar would be very instructive, since they won't sell to us rank amateurs. It would also be instructive for the GPSL attendees to see how a big ZP is launched, but it may not be possible to schedule the kind of launch weather (calm winds, e.g., required to fill a plastic) to fit the GPSL agenda. Maybe the BLAST movie was as good as that can get, short of doing one yourself.

5834. Opentracker NoFIX

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-28 22:36:40 UTC
From: Harry M
Topic: 5834 Message: 5834

At GPSL I flew an Opentracker 1 Rev3 for the first time. I flew the same GPS that I have always flown. I got a lot of "NoFIX" position reports.

I did some testing with the latest firmware on both the OT1 Rev3 and an OT1+ SMT. The OT1 is doing it again... a lot of NoFIX positions. The SMT sent every position and never had a NoFIX. I used VisualGPS to monitor the GPS and it does not lose a lock.

Has anyone had similar results?
I have posted my findings to the OT Group also.

5835. 48☐ chute and put in a 12☐ ring?

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-29 01:07:37 UTC
From: k6rpt
Topic: 5835 Message: 5835

Thanks again for all the help. I've been reading all the posts on GPSL for almost a year now and have tracked some of your launches to get some experience in tracking. The recovery stories are always great. I think I will get the 48" chute and put in a 12" ring? My payload will be 3-3.5 lbs, I decided to add a second APRS to the payload (don't give Murphy an equal chance). Thanks Paul for the link to your book, very helpful! I'm putting together the payload box and I built in three ¼ wave 2m antennas pointed down at the bottom of the box, is that ok?

5836. Re: [GPSL] 48” chute and put in a 12” ring?

I like to keep my backup trackers in seperate modules with their own batteries, GPS, and antennas. The antennas are mounted on th side ofthe modules. I only see problems when we're directly beneath the antennas (in their null).

By down, do you mean your antennas are horizontal?

Paul

The antennas are vertical upside down ¼ wave.

Make sure you check the SWR on each antenna once they are mounted on the capsule.
This is VERY important and often overlooked!

Hi Ron,

Is that 48 Spherachute inches or skirt diameter inches? Latter is more advisable. Any spreader ring is better than none, but I'd go bit bigger, depending on the answer to the previous question.

It's not necessary to fly a redundant APRS beacon - you just want something that will give you something to chase that lasts at least 24 hours and doesn't weigh a lot in batteries, in case your primary APRS beacon goes belly up. It should also generate a DF-able signal - like at least 15 sec of carrier every minute, not just a packet burst. You can DF a signal that's too weak to produce readable packet. And once the payload's on the deck, the signal gets REAL weak unless it's hung up high in a tree.

Not sure what you mean by "three ¼ wave 2m antennas pointed down at the bottom of the box". What's feeding them? Is this a phased array? Note that if one is transmtting while the other is receiving, the receiver won't hear squat since it will be desensed big time, if not flat fried, due to strong coupling amongst those close-in parallel antennas.

Better to build your backup beacon in an entirely separate housing with its own power source and antenna, and space it up or down the flight string at least 5 ft. from the primary beacon.

Mounting a 1/4 radiator directly on your payload housing can also create trouble unless you have a 1/2 wave diameter counterpoise between it and the rest of the guts in the beacon. Otherwise, xmtr counterpoise current will run back inside searching for a path to earth, taking the buttered-side-down path.

And if it's rigidly mounted, Murphy will see to it that it gets jammed into the ground on landing - and it doesn't make any difference which side you mount it on. Better to use a wire J-pole - a 1/2 wave radiator fed with a 1/4 wave hi-Zo matching section - lashed with plenty of slack in the copper to the payload line. A vertical dipole with feedpoint on the side of the box also works, but it's got a screwy pattern, and radiated RF still gets inside if the box isn't shielded.

OF course, a 50-ohm resistor will show a GREAT VSWR, but that doesn't mean it radiates raddio waves. Harry's observation reflects my earlier observation that the proximity to the metal goodies in or on the enclosure will affect load impedance of the free-space dipole - which means those bits are absorbing and/or reflecting RF.

Yes it is a 48" Spherachute, how much bigger should the spreader ring be?

The antenna setup is a 2" X 10" peace of aluminum with SMA panel mount connectors mounted 1" in from each end of the aluminum. I drilled a hole with the solder end out of the hole and I soldered a thin steel wire to it. That will be at the bottom of the box with the female SMA going through the bottom of the box. I have 1' SMA patch cables to connect through the foam box and the other end to each of the two independent APRS systems; each has APRS, GPS and battery. The RF output is 5 watts and will run for over 8 hrs, TX every 60 seconds. I thought it would be better to APRS position backup instead of DF. I understand APRS packets are to shot to DF.

Can I put foil inside the box for shielding? The foam box is 11"X9"X9" the kind used shipping frozen foods with interlocking top.

The simplex repeater is on 2m and I know it will be desensed as the packets go out. I have not setup the antenna for it yet.

The camera is a Cannon A560 and I set it up to take pictures every 15 seconds. When I tested it, it lasted for 5hrs and took about 1200 pictures.

I hope this better describes the payload.

Greetings,

What are you using for the APRS trannys?

5 watts is way overkill,

500 mw (1/2 watt) is more reasonable. we have been using 300 mw for
years.

Welcome into the fun world of high altitude ham ballooning. Each group has their own suggestions. You will need to pick and choose what you think will work best for you. Reach For Space does flights in the upper Texas Panhandle and spills over into northwest Oklahoma and southwest Kansas. We have been flying since 1993. Our motto is "Have tailgate, will launch". During this time we have learned several lessons of what not to do.

If you use a quarter wave vertical, what will be the ground plane part of the antenna? The long rubber duck antennas provide as strong a signal as the 19" verticals and the duck antenna will flex when it hits something. As mentioned, a vertical tends to have a dead spot directly under it. I prefer to use coax dipoles. Peal off 19" of shild and let the coax dangle beneath the payload. RG 174 is very light weight and the diople does not have the dead spot under neath. RG 58 or 59 also work as well.

The addage "anything that can go wrong, will" seems to be all to true. Knots in string come untied. Now we double knot and cover each with hot glue. Everything twists, turns, spins, and dances around. Just in case your cut down does not work, be sure the lenth of string from balloon to parachute is long enough to let the remains of balloon fall below the parachute and not become tangled with the chute. Our last flight the chute did not deploy and payload tried to make a crater, Find Me Spot , while packed in 2" of foam, shifted and the control buttons became wedged under the case and turned off the unit. The 28.322 oscillator module was mounted in a socket, it left the socket! The aprs unit was working fine on the ground and died 10 minutes into the flight. Hint, always use fresh batteries. The camera person did turn on the camera, but failed to start the timer. We had Find Me Spopt and the camera in a package at the very bottom of our payload
string for the camera to have a clear view.

You have a lot of chute for a small payload weight. I suggest that the ring diameter be at least half of the chute dismeter. When you make your chutes, remember it helps to have a vent hole in the top!

When I have access to two aprs units, I like one to be on 144.390 and the other to be on 144.340. The 390 frequency is so busy it is difficult to get good copy of the balloon in the chase vechiles. The 340 works much better for direct reception. When the payload is back on the ground I have to request the mobile units turn off their beacons on 390. BTW, 1 watt will give you much longer hours of possible operation and do just as well as the 5 watts. Much of the flight time, your payload will have a tremendous line of sight and put a strong signal into the digipeaters.

We share with you in your excitment of a first flight. Best of luck. 73, Jerome Doerrie, K5IS Flight Director, Reach For Space.

Topic: 5835 Message: 5846

Hi Ron,

As I noted earlier, a Spherachute inch is measured around the circumference of the inflated canopy - or about 1.5 times the inflated skirt diameter at the shroud line attachments. So you effectively have just a 2.6 ft parachute, measured at the skirt diameter. This is pretty small, and way too small for a 12 lb payload. A 72" Spherachute would be the smallest that I'd recommend.

But since you've already got it, you'll just need a 8 inch diameter spreader ring.

Re your antenna configuration: apparently, you have two 19" whips spaced parallel to each other and only 8" apart. With your xmtrs running 5W, it's quite likely that you'll burn out the front end of receivers on the adjacent antenna. You could probably avoid this hazard by putting one of your APRS rigs on 70 cm with the other on 2m, picking a 70cm freq that avoids the 3rd harmonic of the 2m rig.

And 5W is way overkill for inflight APRS. We get full quieting signals 100 miles downrange using 300 mW xmtrs on the payload. So you might consider switching to low power. This may allow for more than 8 hrs of battery life - and note that if the batts die before you locate the landing site, your chances of recovery diminish sharply.

SMAs are pretty fragile connectors, and I doubt that a steel wire soldered to the center conductor pin would survive much disturbance, such as thrashing about during post-burst chaos (the Dreaded PBC!) and very unlikely even a gentle landing without breaking off - and that really hurts your ERP. BNCs are a lot stronger, but I still wouldn't trust just the strength of steel-wire solder joint with those either, since I've seen several fail in flight and during landing already. Things should be made as light as possible, except when they're exposed to the environment outside the payload housing.

If you put your two APRS antennas on opposite sides of the box, like top and bottom, then you'll have a fair chance of having one survive a landing, but there's no guarantee that the payload won't tumble during a parachute drag if it's windy. This will also go a long way towards isolating the receivers from the other xmtr.

The 10" Al antenna mounting plate is about half the length of a single 1/4 wave counterpoise for 2m. You could extend it laterally using some of that steel wire used for your whips.

And yes, ordinary kitchen Al foil works fine for a shield at 2m and up. But the seams must be bonded - any non-conducting seam over about 1/10 wavelength will let RF thru. Al or Cu tape with conductive adhesive works well, but it's expensive. And no shield will prevent common-mode RF current from passing

into the box on a wire running thru the shield. This is why recommend using a Hi-Z antenna (J-pole) or a full dipole - either of which will mitigate the common-mode counterpoise current flowing on the outside of the coax shield.

Now, your simplex repeater can serve as a great DF beacon, and could easily stand in as a backup beacon in lieu of of a 2nd power-hogging APRS. Provided, of course, that its antenna and battery survives thru recovery.

Hi Ron,

I'd crank that power output down to under 1 watt.... I typically run about 200 to 300 milliwatts with great results....any more than that is not necessary and will give you a lot more battery life in case you need that time to narrow down the landing zone.

I get over 20 hours on my APRS tracker at 200 milliwatts....you also have to consider that the capacity of that lithium pack will be a lot less when cold....I usually just cut my battery life estimate in half to be conservative to compensate for cold batteries.

Also, your capacity goes down with higher currents...they usually specify the Ah rating for a continuous current draing of 1/5 the rated capacity. The link below has a detailed datasheet of the performance of your battery under different loads and temperatures.

From: k6rpt
Topic: 5835 Message: 5848

Mike, my payload will be 3-3.5 lbs and APRS is TX only, no RX. I can change the simplex repeater to 70cm to avoid the Rx from being desensed.

I'm using a Byonics MT8000FA, Garmin GPS 18 # 010-00321-56 and Li-Ion 18650 cells 11.1V 2200mAh Battery Pack. The Byonics MT8000FA has adjustable RF out.

The second system is BLGPS 2M HP http://www.bigredbee.com/blgps_2mhp.htm this one is being shipped today.

I like the RG 174 coax dipole idea. I can change to that configuration easily and avoid antenna damage on landing. I can change the first APRS to 1 watt and get longer battery life. The second APRS I will test the RF output when I receive it (about three days).

Thanks, Ron K6RPT

Hi Ron,

I also concur that it's a good idea to have your backup APRS beacon as a separate payload with separate batteries. I'm a big fan of redundant trackers....in fact I like to have 3 GPS trackers on each flight. I usually fly 2 APRS trackers and a 2m beacon or multimode transmitter on a clear channel. You'll find that the FindMeSpot is a good 3rd backup unit (7 ounces of insurance) as it will tell you where it has landed without having to be near a digipeater since it uses the GlobalStar satellite network...this has saved me a couple of times....it's $150 plus $99 a year subscription.

As far as a vertical ground plane....keep in mind that since its on the bottom of your payload, it will take the impact force of landing.....the weak point of such an antenna is where the wire element is soldered into the center pin of the coax connector....so reinforce that weak point before flight. The J-pole is a good way to go, but you might want to stiffen it up with a dowel rod to keep it from folding up when it lands....it also runs the risk of being yanked out of the payload where the coax connector attaches so put some strain relief at that point. I've had good success with a vertical dipole (center fed) with the elements made out of #22 wire taped or heatshrinked to a wooden dowel rod....about 20" for each wire will get you close. Just make sure not to attach the vertical dipole near large metal surfaces or objects in your payload....also if I understa
nd your vertical antenna construction correctly, you may have an impedance problem since the best match is to have the ground elements at a 45 degree angle to the radiator....the radiosonde folks basically have a 1/4 wire soldered to their PC board pointing straight down...they use #14 insulated solid conductor wire for that part....then for the ground plane they have two wide thin metal plates which point up at a 45 degree angle on each side.

I see from QRZ that you are in San Jose?...keep in mind that the Summer wind patterns could potentially kick you out to sea very easily....you might consider going into the central valley to fly...I've flown out of that area a few times and have landed near Tracy and Modesto a number of times.

Subject: [GPSL] Re: 48☐ chute and put in a 12☐ ring?

Yes it is a 48" Spherachute, how much bigger should the spreader ring be?

The antenna setup is a 2" X 10" peace of aluminum with SMA panel mount connectors mounted 1" in from each end of the aluminum. I drilled a hole with the solder end out of the hole and I soldered a thin steel wire to it. That will be at the bottom of the box with the female SMA going through the bottom of the box. I have 1' SMA patch cables to connect

through the foam box and the other end to each of the two independent APRS systems; each has APRS, GPS a
nd battery. The RF output is 5 watts and will run for over 8 hrs, TX every 60 seconds. I thought it would be better to APRS position backup instead of DF. I understand APRS packets are to shot to DF.

Can I put foil inside the box for shielding? The foam box is 11"X9"X9" the kind used shipping frozen foods with interlocking top.

The simplex repeater is on 2m and I know it will be desensed as the packets go out. I have not setup the antenna for it yet.

The camera is a Cannon A560 and I set it up to take pictures every 15 seconds. When I tested it, it lasted for 5hrs and took about 1200 pictures.

I hope this better describes the payload.

I like the RG 174 coax dipole idea. I can change to that configuration easily and avoid antenna damage on landing.

Hi Ron,

OK, I thought you might be using a separate HT for a radio. But if you operate on 144.39 MHz, you'll be transmitting "in the blind" without knowing if another signal is already there. And 144.39 is a pretty busy freq! So you might consider moving down to 144.34 or .36, as some other ARHAB groups have done. The downside is that you can't exploit the free infrastructure of digipeaters and I-gates, but that's not tough to overcome if you can line up a few I-gate stations to get you into findu.com or aprs.fi.

Some of the Byonics generators have exhibited low temperature problems, so I'd recommend cold soaking them (powered down) in a zero F (-16C) food freezer to see if they still run when that cold. Not familiar with the Big Red Bee, tho.

Thanks for reminding me of the coax "bazooka" antenna. I've built a couple of those using RG-174 and RG-58, but never got VSWR under 2:1 except with VERY tedious tweaks to the spacing between the folded-back 1/4 wave shield and the sheath. But they can mitigate the counterpoise current issue.
Be sure to strap the antenna radiating elements to a payload line under tension to keep it vertical during descent; otherwise, it'll fly up and lash around, most likely shattering the chilled PVC sheath and possibly breaking the whole shebang off.

It's a good idea to keep your Li-ion cells close to heat-generating parts in the payload. We've encountered Li-ion shutdown during descent - the worst possible phase - but they came up fine after warming up on the deck. Li-ions get puny below -20C, and I try to keep ours above -15C. Your polystyrene enclosure ought to keep everything above -10C during a typical 2.5 hour daytime flight to 100K', however.

Good luck on your first flight, and happy landings!

Its tough to build an omni that doesn't have a null somewhere. But you can ameliorate some of that problem by not exacerbating the null with a separate one on your mobile vertical when directly under the balloon. If you have a mag mount on your mobile, just clamp the antenna to the side of the car with the radiator horizontal. It works, but you have to be careful passing!

It seems there is a problem with the newer firmware on the OT1. Going back to firmware 53969 fixes the problem.

agreed,

But i was still wondering about that antenna he is talkinga about that
does not have the null pointing down.

Thanks, Bill
I'd not seen a Li-ion V vs T vs t at constant current like that
before. Spooky what happens at -20C! I think that's the electrolyte
losing ion mobility - like molasses in January!

Well, there IS a pattern null off the end of any straight wire radiator,
whether it's a monopole or dipole. This assumes free space, of course, and
as we've all learned, space ain't free - not even near space. But it can
be cheap if yer careful :=}.

If you want to avoid having a null under the payload, then make your radiator
horizontal. Of course, then you'll get spin fading.

As I mentioned earlier, tipping your ground antenna helps a lot. And when
you're under the payload, your range is minimum - like 20 miles or less -
so space attenuation is at a minimum.

5858. Antennas

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-30 05:50:53 UTC
From: k6rpt
Topic: 5858 Message: 5858

I will order a 48" Spherachute and have them sew in two crossed lines over the hole to attach the balloon line to and I will add an 8" spreader ring. According to Spherachute chart 3.4 lbs is the lower weight limit for this size chute.

It sounds like vertical antennas have a null off the tip and I would think the null would be a very large area at high altitude. The coaxial dipole could wrap around the payload on the descent, and also having a null.

I would like to ask what kind of antennas are some of the group using and how are they are attached to the payload.

Thanks again for taking the time to share the learning experiences from your flights. I'm hoping to have a successful first flight.

There's so much movement in near space that the null will only sweep over
you for a moment. I don't think it's an issue unless you are using a rubber
ducky antenna inside a car.

Very true, and as I stated before, if you were to have a null anywhere
in your radiation pattern,, directly underneath is where it should be
for that is the path that has the lowest pathloss anyway.

5861. Re: [GPSL] Antennas

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-30 14:58:13 UTC
From: Bruce Coates
Topic: 5858 Message: 5861

Hi Ron

for the first 3 flights of SABRE we used a vertical antenna in the payload lid with a ground plane integrated into the lid. Although this worked fairly well, it got beat up quite badly on landing. Starting with flight 4 we started using two vertical antennas dangling under the payload with a single counterpoise running across the bottom of the payload and out the side. The radiation pattern is pretty odd, sort of like bent a torus on a 45 degree angle. The radiators we use are made from guitar string. The larger string are wound with bronze and are quite easy to solder. These are light, flexible and just about indestructible. Since my wife plays the guitar, I have a great supply.

As Paul mentioned there will be nulls in the radiation patterns of any antenna and the movement of the payload will make it impossible to predict exactly where they will point. In out experience, the bigger problem is the null on your receiving antenna. A mag mount 5/8 antenna on your roof will work well at a distance, but it will work very poorly when you're under the payload. A 1/4 wave mag mount is a good compromise. In some situations, I've found my hand held whip held at an angle works better than the car antenna when you're almost directly below the payload.

Our experience has shown:
- We have never been able to detect the null on the payload antenna due to its movement.
- We have noticed the null on the receiving antennas on our cars.
- We only run 300 or 500 mW to power but have always had good signal reports at over 150km.

Good Luck.

I'm still willing to take this on. But automation of it may take a
little longer than I originally thought.

From: k6rpt
Topic: 5835 Message: 5868

Hi Bill,

How did you end up in California doing a launch? I was thinking central valley would be a good place also, but I have no idea how to predict a possible landing area. Would you be able to help me with a good place to launch? I'm hoping to launch in 6 to 8 weeks

Ron K6RPT

Go to www.nearspaceventures.com. On the left there is an online flight predicter called BalloonTrak.

Actually Paul, I've found quite the opposite to be true unless during the descent phase. Over 90k feet the null zone extends over a 5 to 10 mile?diameter in my experience. It would have to be whipping around a lot since the null zone is about 20 degrees beamwidth of the end of a vertical element. Better to have the car's whip antenna offset or even stuck on the side of the car like Mike suggests when chasing directly underneath a payload. Although for a first flight I wouldn't worry too much about it unless you plan to keep directly underneath during the chase. I once put a 10 milliwatt 434 MHz SparkFun transmitter on a balloon....the null zone was quite evident and extended 5 miles in either direction as I drove directly underneath the balloon...I could still barely hear it but it sure got strong when I drove past the null zone. With the power levels Ron is planning he might not even notice the effect.

There's so much movement in near space that the null will only sweep over you for a moment.? I don't think it's an issue unless you are using?a rubber ducky antenna inside a car.

?

Paul?

On Thu, Jul 30, 2009 at 12:50 AM, k6rpt <Ron@...> wrote:

I will order a 48" Spherachute and have them sew in two crossed lines over the hole to attach the balloon line to and I will add an 8" spreader ring. According to Spherachute chart 3.4 lbs is the lower weight limit for this size chute.

It sounds like vertical antennas have a null off the tip and I would think the null would be a very large area at high altitude. The coaxial dipole could wrap around the payload on the descent, and also having a null.

I would like to ask what kind of antennas are some of the group using and how are they are attached to the payload.

Thanks again for taking the time to share the learning experiences from your flights. I'm hoping to have a successful first flight.

Yeah, I see that. You're right.

I seldom am under the balloon during chase, so I don't see the null very
often. I may be on the edge of the null more than in the center of it. I
suspose even with the rocking back and forth of the antenna, you can still
spend a lot of time in the null.

If you've run a fairly confident prediction, best plan is to haul on out to a high point near the predicted landing site and just spot check the actual vs predict enroute to make tweaks. This works best in the summer, when you don't have to keep up with a 120 mph jet stream, of course. Or have trackers on site near the predict at launch time.

Mike's Advice is EXACTLY what we here do at Near Space Sciences.

We have the recovery crews either right at the predicted landing spot
or awful close to it.

And we have the predicted path on the maps and we monitor the predicted
vs the real time track, and once the flight is about 30 min into the
flight, if the payload is tracking 3 miles south of the predicted
path, the team moves to a point that is 3 miles south of the original
landing spot.

Ever since we have been doing this every flight has been a visual
landing. The chase crews watch it land.

5875. Re: [GPSL] Predicting landing sites

Yahoo group: GPSL (2009 — 2010)
Date: 2009-07-31 23:35:13 UTC
From: wb8elk@aol.com
Topic: 5875 Message: 5875

Ron,

www.eoss.org (http://www.eoss.org) has Balloon Track that you can download to predict your flight path....it is pretty accurate within about 3 days of launch....but you can predict out to longer than that to get a general trend....it will also allow you to choose a landing spot and backtrack the prediction to show where you'd have to launch from to achieve that landing site goal.

There is also on online version at: _www.nearspaceventures.com_ (http://www.nearspaceventures.com) .... click on "Web Based Balloon Track on the lower right of that page.

I was launching a couple of balloons at Pacificon hamfest and also at Fresno hamfest back in the early 90s....I used to live in Berkeley, Santa Barbara and Sierra Madre near Pasadena. I've also flown from the Mojave Desert, Santa Barbara, Carmel Valley and San Clemente.

I usually enter 1000 feet/min ascent rate and about 1100 ft/min descent rate for the calculations. You can also use the Ascent rate calculator to determine the amount of nozzle lift to achieve the desired ascent rate for your system once you know the payload weight.

Well, $8K to get to LEO ain't too shabby. NASA charges in the 5-figure range per pound! But in any event, it's not coming back home - NASA's recovery rate is less than perfect.

5878. New ARHAB website now up and running for launch announcements and records

Yahoo group: GPSL (2009 — 2010)
Date: 2009-08-04 08:08:43 UTC
From: wb8elk@aol.com
Topic: 5878 Message: 5878

Keith WA0TJT of Near Space Ventures and I (WB8ELK) have taken over doing the updates of the _www.arhab.org_ (http://www.arhab.org) website for launch announcements and records submissions.

Please note that the email address to submit a launch announcement has changed to the following: _flights@..._ (mailto:flights@...)

To submit a potential ARHAB record please email: _records@..._ (mailto:records@...)

Also please use just the _www.arhab.org_ (http://www.arhab.org) URL as the

http://showcase.netins.net/web/wallio/ARHABlaunchannouncements.htm address will no longer show the current updates.

Ralph W0RPK has done a great job keeping us all informed of ARHAB balloon launches over the past 5 years....and we owe him many thanks for his tireless efforts.

We plan to keep the launch announcements and records updated on a regular basis although during this transition phase, we may not be doing the bi-weekly email updates on _Balloon_Sked@yahoogroups.com_ (mailto:Balloon_Sked@yahoogroups.com) We recommend to instead keep checking _www.arhab.org_
(http://www.arhab.org) for launch announcements and updates.

- Bill WB8ELK and Keith WA0TJT

Thanks, Bill & Keith, for filling Ralph's enormous shoes with this valuable service. The ARHAB community owes you a great debt of gratitude!

BTW, EOSS-145 was recovered 30 min after landing at 39.29602° N, 103.2943° W, just for the record. The students are now busy finishing their reports and presentations for JPL.

And I was alarmed to read to read in the copy of ATVQ that Nick brought back from GPSL that Gene Harlan WB9MMM, publisher of ATVQ, went SK last year. Even more thanks are due to you, Bill, for picking up where Gene left off. If I ever get back to my high-efficiency 1.2 GHz 3W power oscillator based WBFM ATV xmtr project, I'll send you a write-up.

5881. Balloon size?

Yahoo group: GPSL (2009 — 2010)

From: k6rpt
Topic: 5881 Message: 5881

Thanks for the help on predicting your flight path. I'm using the online version at: www.nearspaceventures.com Web Based Balloon Track. It works great!

What size balloon do I need for a 3.5 lb payload and where is a good place to buy one?

How do you know how much helium to put in the balloon for the proper lift to weight ratio? (for 1,000 feet per minute)

Are there any tips for reaching the highest possible altitude?

Thanks, Ron K6RPT

Liftwin, also at NearSpaceVentures, will tell you the amount of lift.

I go with three pounds of positive lift in my balloons. That way I'm sure
the balloon won't stall and stop rising.

I have flown balloons as small as 350g with payloads of about 6 lbs - that's probably the lower limit of what you'd want to fly.

A 1200g balloon should get you to 90-some thousand feet, maybe even to 100,000 if you don't fill it too much. Look up the phone contact info at http://www.kaymont.com to place an order. I have better luck with phone orders than fax/e-mail. Cost will be on the order of $60 plus shipping.

There is someone selling 600g balloons on eBay for $30 which includes postage. I got a couple myself - they are in good condition, looks like they've been stored well. I'd have to run the numbers to see how high you'd get with that, but I would guess high 70s or 80s.

Three lb neck lift works OK for 800 - 1200 gm balloons with < 12 lb
neck load. But if you run a "heavy", e.g. 26 lb under a 3000, then
3 lb will only yield about 650 fpm ascent rate and risks a stall.

EOSS fills 1200s with 120 - 125% free lift (gas alone) and 115%
for 3000s. Neck lift at fill equals free lift minus balloon weight.
This a bit lighter than what LiftWin computes, but it's worked out
well for us over more than 100 flights.

Do be aware of "false lift" if there's any wind blowing across the
top of the balloon during fill; if it's over 10 kt, it can produce
a goodly chunk of your target neck lift. On launch, the false lift
goes away, and if you've not tossed in "a little more gas", your
bottom payload my go bounding across the field until it hangs up on
something or breaks off.

Per LiftWin, a 600 gm Totex with 3.5 lb on the neck will make about 83K'
with 6.1 lb neck lift at fill (STP) for 980 fpm.

Ron, that also comes out of LiftWin 0.41 in standard cubic ft (at standard temp and pressure 20C & 1031 mbar). LiftWin will also tell you the filled balloon diameter, but that's not all that easy to measure, since a latex balloon isn't spherical on the deck.

A K-bottle contains about 195 cu ft, and a T-bottle, 295 cu ft, assuming 99% purity and about 2300 psi. Industry standards stipulate that a bottle sold must contain those SCF capacities. Your gas supplier can tell you what you're buying. Beware of "balloon gas", which is intended for filling party balloons and contains 40-60% N2 to keep balloons inflated, although grounded, for days after the He has permeated thru the latex.

When the neck of the balloon is able to float a weight equal to the target, neck lift, plus a little more to compensate for false lift as required, then the fill is done.

Fill a "tare weight" to the target neck lift prior to starting the fill and tie it securely onto your fill tube. Some folks use plastic milk jugs filled with water, others, sand bags, and EOSS uses bags filled with the proper number of pre-measured weights. Be sure to include weight of the fill rig.

I called a helium distributor today; he has a 150 cu ft bottle (industrial grade helium).

Would it be safe to assume that if I emptied bottle into a balloon (until the gas stops) it would be a 150 cu ft?

Honestly, that's about what we do.

For us (in windy Kansas), using scales or ballasts to gauge the lifting capacity isn't very effective. The wind can really blow that thing around, unless you happen to be inside of a large hanger.

You can generally catch a lull in the surface wind shortly after (yawn) sunrise, but that may be valid only for the Colorado front range. Wunderground generally has petty accurate surface forecasts a day in advance. BTW, surface wind is one of ballooning's most serious enemies. If the forecast is for over 10 kt, blow it off for a calmer day.

Here's a video of one of our balloons, UX-5, launched in too-high winds:
http://www.youtube.com/watch?v=zRtXX-rbVJ8
I think the only thing that saved it was that it was underinflated,
and was loose so it could wrap/twist around the people it hit instead
of ripping.

Thanks,
Dan

Pretty much, if it has the standard pressure in it.

The "false lift" problem can be fairly significant. If you have a really quiet morning, you can get a reasonably accurate lift reading. But many mornings there's several knots of wind, the balloon is bouncing around, and the last thing you want to do is futz around with a scale and risk a puncture for a reading that varies several pounds plus and minus.

NSTAR regularly uses T cylinders, which have 290 cu ft at about 2600 psi. If I vent the tank down to 1300 psi (half the pressure), that *should* be about 145 cu ft (half of 290). You can make up your own ratios depending on the size of tank and the standard pressure for it (which I think is generally around 2600 psi for all sizes, but check with your supplier). While this has some inaccuracies, it's a lot better than the 30-50% errors you can get with a scale on a windy day. I only use our scale on a no-wind day as a last-minute dummy check on the lift.

We get our helium as "balloon grade" from Linweld, which is 99 or 99.9% purity. This is less than welding or industrial grade, but cheaper too (welding/industrial is 4 or 5 9's). Ask your supplier for the purity rating if they offer balloon grade - anything 99.0% or better should be fine, and I bet you can get away with 90% if you know and compensate for it.

I was always in the school of never tough the balloon ever you all have heard it from me before,, bla bla bla, I know what works for us we always exceed 100K well maybe 2 or 3 out of thee 47 flights have not. But anyway we were always led to belive from TOTEX in japan before paul even started carrying them about their rules about the balloons and how never to touch them and all that. Then i just seen this video and holy cow, i knew these things were tough with what happens to them in a high winds launch, like stretch to crystal clearness even. But this i honestly would have never belived. Wherever this is must have grass that is like velvet. it sure isn't grass like any here in wisconsin!

I have a question for everyone.

A USB web cam, like you want to do some streaming like bill did,, or whatever. But how far can a USB cable be?

What I want to stream is pretty far from the computer.

How long can you go? and do they even make USB extension cables?

Merle used to monitor the tank pressure at the start of fill and several
times during the fill to get some idea of the delivered volume. If a 295 CF
T-bottle started at 2400 psig, then when it gets down to 1200 psi (with no
flow), then about 150 cu ft had been delivered. This assumes negligible
adiabatic cooling, so Boyle's Law applies:

http://en.wikipedia.org/wiki/Boyle_law

He is too expensive to vent in order to avoid performing mental algebra,
IMHO.

You can get USB extension cables - Jameco is one supplier (www.jameco.com).

See http://www.usb.org/about/faq/ans5, which says not to use more than 5 meters without using hubs.

However, I have run a USB printer through a 30-ft extension with no significant issues. I have thought about making up a weather webcam through about 40 ft of USB cable, but have not tried it yet to see if it will work.

Don't know the answer to the USB cable length question, but Bill streams his video with the built-in webcam in his eeePC netbook (for which he has a Verizon USB aircard). I've carried it around a couple of times at launches. The whole thing probably doesn't weigh much more than a camcorder. Aiming it is just a guess (no viewfinder), but the built-in camera has a pretty wide field of view. It didn't seem to adjust well to bright sunlit scenes, so Bill taped a pair of clip-on sunglasses to it!

> What I want to stream is pretty far from the computer.
>
Another way that might work is use a 2.4GHz FMTV link from a camera or camcorder to a stationary computer with a video capture card, a la WinTV. I have an X10 2.4GHz transmitter/receiver set. The transmitter would easily fit in a medium sized Rubbermaid bowl for weather-proofing. Runs from a 12vDC wallwart that has a built-in X10 power module, but batteries would probably work OK.

6-12 feet MAX with most "normal" USB cables is the upper limit.
Shorter for high bandwidth (hard drives, etc) You can go longer with
slow devices, but they're not usually "manufactured" since it'll be
somewhat unreliable dependent on devices and they won't want the
support costs.

I haven't seen extension done with USB2 but if it can work with
USB1/1.1 a few products exist. For one large A/V install we did we
used a product from IOgear (http://www.iogear.com/product/GUCE51/)
which you can find a few variants of and elsewhere cheaper, most
likely. We used it only for a hub with a keyboard / mouse combo, but
it was reliable and we were almost 100' from the equipment rack to the
install point.

5903. Balloons and filling them

Yahoo group: GPSL (2009 — 2010)
Date: 2009-08-07 01:27:08 UTC
From: k6rpt
Topic: 5903 Message: 5903

Thanks again for all the information on balloons and filling them. I think I will use the KCI-1500 with the following: Balloon Diameter 6.6', Balloon Volume 154 cu ft, Nozzle Lift 6.78 lbs, Peak Altitude 107 k, Ascend Speed 1000 fpm, Free Lift 3.28 lbs and my pay load will be 3.5 lbs. I called the gas supplier and they have the industrial grade at 99 %. The tank sizes are, 150, 200, 250 and 300 cu ft. I will attach a weight of 6.5 lbs "tare weight" to the fill tube prior to starting the fill, providing the weather permits. The 200 cu ft tank has 2400 psi, so when the psi on the tank drops to 922 psi when the valve is off, I should have 154 cu ft. I called Kaymont and they are out of stock on the KCI-1500 and did not know when they would be in. I hope it does not take them long to restock. I assume you would use a regulator for the tank that would fill the balloon quickly?

-Ron K6RPT

Topic: 5903 Message: 5906

Hi Ron,

Does your 3.5 lb neck load include a parachute?

Since Totex products typically are transported from Japan by sea, restocking can take a while. You might consider going with the more popular (and heavily stocked) KCI-1200. That'll save you some $$$ in rubber & gas and still get you to 100K', +/- a little.

EOSS used to use a regulator on the tank, but we ran into too many problems with it freezing up from ambient humidity - so we just go directly into the 1/2" rubber fill hose and use the tank valve to control flow. Crack and close the valve a skosh before attaching the hose to the balloon to free up any sticktion. Some folks have used ordinary garden hose, but it's a bit stiffer and heavier.

Start your fill very gradually, watching out for twists and "luffing". Once the balloon has enough gas to lift it off the tarp, you can crank up the flow.

Another hint: if you have some investment in the flight already when you're ready to fill (a long trip to the launch site, deployed trackers, etc), it might be a good idea to have a spare balloon plus gas to fill it on site, just to keep Murphy at bay. Most gas suppliers will refund uncracked bottles; our's uses a "medical seal" on the valve guard to ID uncracked bottles.

> Thanks again for all the information on balloons and filling them. I think I will use the KCI-1500 with the following: Balloon Diameter 6.6', Balloon Volume 154 cu ft, Nozzle Lift 6.78 lbs, Peak Altitude 107 k, Ascend Speed 1000 fpm, Free Lift 3.28 lbs
and my pay load will be 3.5 lbs. I called the gas supplier and they have the industrial
grade at 99 %. The tank sizes are, 150, 200, 250 and 300 cu ft. I will attach a weight
of 6.5 lbs "tare weight" to the fill tube prior to starting the fill, providing the
weather permits. The 200 cu ft tank has 2400 psi, so when the psi on the tank drops
to 922 psi when the valve is off, I should have 154 cu ft. I called Kaymont and they
are out of stock on the KCI-1500 and did not know when they would be in. I hope it does
not take them long to restock. I assume you would use a regulator for the tank that
would fill the balloon quickly?

if he is using the pressure method to calculate how many cuft he has
used, how does one do this with a direct hook up?

I played with one a few years ago. While it operated OK, I wasn't impressed with the video quality (at the time), and it didn't lend itself to the kind of customization I needed. I ended up sending it back.

5911. Re: Balloons and filling them

Yahoo group: GPSL (2009 — 2010)
Date: 2009-08-07 23:24:20 UTC
From: k6rpt
Topic: 5903 Message: 5911

If no regulator is needed, I will build a setup that will have the 2600 psi gauge between the tank and a new gate valve. I will fill using the new gate valve and shut it off to check tank psi during the fill. I will look for a very light and flexible fill hose with an od of 3 cm. The 3.5 lbs is approximate payload weight, I just received the chute today and I will add it to the payload weight.

Has Bill recovered his payload from today's launch?

Thanks, Ron K6RPT

Better be sure that gate valve is rated for that sort of pressure. It's also
a good idea to get a kink-resistant hose; a kinked common rubber hose doesn't
stand a chance against 2600 psi. And you could get by with a bit smaller
hose; a 1/2" ID does provide some flow resistance that helps keep flow under
control.

I think Bill did post a landing lat/lon, so at least he knows where to fetch
it from if he got his hands on it yet.

Thanks Mike, I will make sure the valve is good at 2600 psi and maybe a restrictor washer might be good to help regulate the flow.

From: Zack Clobes
Topic: 5914 Message: 5914

Ever since GPSL this year, I've been hard at work on a new website and some new equipment to get back into flying.

For those of you with cross-links or bookmarks, please update our links accordingly:

http://www.projecttraveler.org/traveler/

Thanks,
Zack Clobes, W0ZC

5915. Balloon Schedules

Yahoo group: GPSL (2009 — 2010)
Date: 2009-08-10 18:36:48 UTC
From: Keith Kaiser
Topic: 5915 Message: 5915

Aeronauts,

We've been hard at it here folks. A new and improved announcements page has been created for your enjoyment. Please see it here; http://www.arhab.org/ARHABlaunchannouncements.html

One of the new features is a link to a form you can use to submit your launch announcements with. It does not automatically update the page, I still have to do that by hand, but it makes the submission easier I hope.
Please note too that I plan to use colors to indicate if a flight has launched (green), cancelled (pink), or is still pending (white).

I would really appreciate everyone sending the latitude and longitude of their launch in decimal form.

What other links or information would you like to see on the home page (arhab.org)?

If you like these changes, tell a friend, if you don't tell me.

Thanks..

are we going to be getting a day or two before a scheduled flight an e
mail version of this. or are we now required to gom and look for ourselves.

not that this is any trouble, just a good thing to know if we need to
or not?

Excellent question Joe.

For now you will need to go and look for yourself. I'm going to try and send an eMail out every time there is an update to the schedule but not the schedule itself. The eMail will have a direct link to the schedules page.

Eventually the goal is to make it so each of us can update the schedule for ourselves. Once this is in place a reminder eMail will probably only be sent once a week.

There's a web site at:

http://www.changedetection.com/

which EOSS uses on some of its announcement and prediction pages to allow users to subscribe to brief emails with links to go out whenever a particular web page is updated. That might be a handy way to get the word out to folks w/o requiring frequent (and often fruitless) visits to the ARHAB site.

If interested, EOSS's Wiz o' de Web, Rick N0KKZ, can tell you more.

From: Keith Kaiser
Topic: 5920 Message: 5920

Chris, by anybody's definition you are an aeronaut. Welcome to the group. I would be pleased to publish your flights, we may have to start a new category for them but publish them we will. As to Amateur Radio, well we already have a couple of groups who use other than Ham equipment, so I don't see that as an issue.

Be sure to prepare a paper to give at next years GPSL (superlaunch.org) which if things work out will be at the NASA Columbia Balloon Research Center in Texas.

Taylor University will be launching from Fishers Indiana as part of the 150th anniversary of air mail.

The first airmail flight was in 1859 by John Wise in his jupiter balloon check out the site below for info.
http://www.smithsonianmag.com/history-archaeology/object-aug06.html

We will be launching from the grounds at Conner Prairie, sense this is a outreach flight the APRS and the crossband repeater will be onboard.

Flight #: 202
Flight ID: CP001
Date: 8-15-2009
Time: 3:00PM EST

APRS: 144.390 KB9ZNZ-1
CROSSBAND: Uplink: 144.36 Downlink: 446.025

Hi gang,

While not exactly balloon flight, but they do go to altitudes that like us few others go to.

I'm a follower of the Brit show Top Gear. i know i'm a gear Head, and these guys are just plain funny!!

Anyway one of the trio gets to go on a ride I'd love to do if given the change. He rode a U-2, how cool is that? I know they exceeded 70K and don't remember how much Higher they got to but still way cool

It's at a embedded video at an Astronomy site I was passing through looking for Persied predictions,

Check the movie out way cool!

5923. Flight levels?

Yahoo group: GPSL (2009 — 2010)
Date: 2009-08-12 10:42:14 UTC
From: Joe
Topic: 5923 Message: 5923

I was wondering, what the curve would be or looklikeif you were to plot standard average cruising flight levels for aircraft.

I would think if you looked at only commercial passenger and cargo planes it would be a simple bell curve.

But I guess it probably would be more of a triple peaked curve if you add in private aircraft like cessenas and thenadd the military?

Anyone have a chart or graph that shows these flight levels?

This kinda would be like a traffic congestion map that shows where the most traffic is elevation wise true?

Anyone know of anything out there like this?

Joe

I'm not aware of any existing statistics for that, but there is a website called flightaware.com that will let you see any flight that is airbone with an IFR flight plan. On the left-hand menu, you can ask to see a random flight, so I wouldn't think it would take but 20 minutes of time to put together a spreadsheet and/or run some stats off of dozens of flights.

Keep in mind that these are strictly IFR-planned flights. I'm not aware of any comparable tracking system for VFR flights. The good news is that most VFR activity is under about 6,000AGL, and absolutely tops out at 18,000 (FL180) per regs.

If you put something together, I'd love to see your data.

Yeah it I would think be published someplace ya know. Might be
interesting to see any operational windows of lesser activity. In other
words like us the planes use this altitude of X just passing through
to get to the level they will cruise at. so the "Zone" should have
less population

Some time ago now someone here at work had set up an ACARS receiver and some software to analyze the incoming data. From that he had a real time map of all the within line of sight aircraft that were reporting position with ACARS. I really don't know much about it but ACARS is a bit like the ham radio APRS but for aircraft. Some quick web browsing shows a number of products avaliable for receiving and analyzing ACARS data. Might be worth looking into.Jim Hannon

I'm not positive, but I believe that ACARS is primarily used on the airlines, and that you would be missing a lot of the private/corporate traffic.

Some time back a friend sent me this.
I have no idea as to the source.

Everything in yellow is an aircraft.....

It is a 24 hour observation of all of the large aircraft flights in the world, condensed down to about 2 minutes. From space it looks like a beehive of activity. You can tell it was summer time in the north by the sun's footprint over the planet. You could see that it didn't quite set in the extreme north and it didn't quite rise in the extreme south.

As evening approaches, the traffic is predominantly from the US to Europe and when daylight comes, the traffic switches and it is predominantly from Europe to the US .

Hi Greg

I just got mine and and it definitely does log the altitude. I even checked with the manufacturer just to be certain. It's also pretty efficient ac compressing the data. I cranked up the logging on mine to once per second and it recorded over 11 an a half minutes of data in just 6 kilobytes of memory or about a 10:1 compression ratio. Once you use the Log Decompress feature in Skytraq you end up with a clear text file in the format shown below. it also generates a KML file. Very cool. I hope to get this little fella up on our next flight later this month.

WNO TOW Time Date DECEF_X DECEF_Y DECEF_Z ECEF_X ECEF_Y ECEF_Z Speed Longitude Latitude Altitude Mode
1544 359629 3:53:35 8/13/2009 0 0 0 -1123972 -3762406 5009647 0 -106.633 52.09633 319.2962 1

From my own experience, I think most jets like to cruise between FL330 and 390. Not many can comfortably make much over FL400, and the air is too thick below FL300 for efficient cruise. I managed to coax my A4C up to FL450 once, but that's about all I was able to accomplish that flight, starting out with a full 9300 lb of JP4.

The turboprop commuter short-hop birds do just fine at FL250 and below, but they don't comprise the majority of the commercial air traffic.

General aviation recip props get along fine below 10,000 ft MSL, and must stay below 15,000 unless they're pressurized.

That from an old, not-bold, ex-pilot.

The other thing to consider is that on a short hop (think Wichita to Denver, or Dallas), most jets spend most of their time either climbing or descending. Even though that CRJ is going to climb up to FL330, statistically if you're going to have a strike, it probably won't be at full cruising height yet.

Just food for thought... I'm not sure what your intentions are for this data.

Hi Greg

That remains to be seen. As Mark mentioned in the original post, the spec claims that you can exceed either the speed or altitude limit but not both, just like the Garmin units that many people fly. Only a test flight will tell us for certain. I'll be posting my flight results to the group.

Good Info Mike.

So if you were to try to avoid traffic of course as we all knew stay as high as possible, But there is a small window at a mid level also by the looks of things yes? Like a small window between ohh 25K and 30K?

Yes?

Hi Joe,

Well, I recited typical enroute cruising altitudes. But by 'n by, the jet aeroplanes have to get up there from and back down to zero AGL. And those climbs and descents occur within about 50 miles of airfield. So the only "safe" altitudes for balloons lie in the relatively unpopulated airspace above about FL450 - and FL600+ for sure.

Topic: 5939 Message: 5940

By coincidence I was just now following up a link given in a post that arrived just before yours and eventually clicked my way to a page with a novel idea for a cut-down device using amateur rocketry ignitors in small sealed plastic tubes. That same page also had an idea about making a very lightweight (30g) radar reflector out of carbon fiber kite spars and metalized plastic/paper ("Space Blanket" material).

It'd probably be way less expensive to make than the commercial one in your link. Other than cost, my only other concerns about the commercial one would be weight and water resistance, although as the ad says it's made of "plastic-metal foil laminate," it might also be lightweight. As it is advertised in a boating catalog, I'd also think it'd be water resistant, so either way you'd probably be OK.

BTW most small aircraft, as far as I know, still don't have radar, and ATC may be more interested in transponder targets than reflective ones. So, it's possible retro reflectors may not be of any value on a balloon unless the balloon flight has been coordinated through the FAA. Can't hurt though.

Here's the link:
> http://wiki.ukhas.org.uk/ideas:flight_support#pyrotechnic_cutdown_device

More on the cut down device: The fact that the rocket motor ignitors only require 2A at 3V for a few milliseconds permits them to be fired from energy accumulated in a capacitor from a very small battery, as shown in the RC/FET firing circuit shown further down the page.

I have found that air traffic control towers do not see the radar reflectors
on balloons. Perhaps that data is filtered out for them?

I think it might be a option to filter or not.

Back in the mid 90's we had an awesome supervisor in chicago. he loved our flights. he wanted pictures videos, copies of everything after every flight.

And to this day I still remember on one video flight, during the flight we get a phone call and it's him, hes talking and then asks thet this is a video flight again right?

Yes,,

and he says what way is the camera looking?

anywhere I say i can make it look anywhere.

he says to make it look down.

He says is it looking down? and i say yup.

he say keep watching closely,

keep watching

keep watching get ready,,

then all of sudden here flys by a DC-10 it was pretty small about 1" on the TV screen (Big TV a 27" screen) but he goes I guess by the sounds that you just saw it, he was watching the reflection from the balloon. and knew the altitude was from the gps too. was way cool.

But even before the GPS's were used, the wonderous Ohare special they were watching it as it came down, and as it landed right in O hare,

so I guess they can see it when they want to?

Hi Ron,

Radar reflectors are only required by FAR-101 for non-exempt flights, and the FAA doesn't look at primary returns any more - they rely on Mode C or S transponders. Accordingly, I can't think of any ARHAB groups who fly one. EOSS's COA for its heavies includes an exemption from the radar reflector so long as we I-gate our APRS onto findu.com.

But you could fly one if you wish so NORAD will see ya, although they don't require that much radar cross-section.

One downside to a radar reflector is that it creates a LOT of drag, and during descent, it could actually tip the parachute sideways - where it really doesn't work so well.

One caveat re pyrotechnic cutdown devices it that they can ignite a grass fire if they go off after landing. And making your firing circuit TOO sensitive in the presence of strong RF, like from a 50W mobile rig, could set it off accidentally.

Primary returns are what are reflected from the aircraft, and anything else
that reflects radar energy - like nearby cars, buildings, etc - the latter
is known as "clutter" because it really clutters up the controllers' scope
displays. Primary returns contain accurate position info, but only those that
are associated with transponder sigs get pre-processed and are replaced by
icons on the scopes. Controllers CAN enable primary returns, but would do
that only in the event of a transponder failure on a bird he's controlling.

From: Mark Conner
Topic: 5947 Message: 5948

Many have settled on 144.36 as a second channel. NSTAR used to use
144.34 MHz, but that is often used as a simplex coordination channel
for ATVers. It was used a lot by ARHAB as a way to alert ATVers that
an ATV-equipped balloon was aloft, and is probably OK if that's the
case. But if you're not flying an ATV payload, it's probably better
not to use 144.34.

Because the CA spectrum is so crowded, you may want to see if it's in
regular use beforehand though. Nobody else can really 'own' it, but
if there's a choice something else might be better in CA.

I know the cut down device wasn't the main subject of this thread, but I don't think this idea should be dismissed too quickly.

I went through my amateur rocketry phase before Estes and others started making commercial rocket motors and ignitors, but from what I've seen more recently at public rocket launch events, I don't picture a modern rocket ignitor as a highly explosive device. I think of them as being more like an electrically ignited match that, once ignited, flares into a small flame that only burns for a few moments (since there's no matchstick to ignite).

The separation of the cut down device is caused by the fact that the ignitor is sealed gas-tight inside a frangible plastic tube that is sealed at each end with epoxy. The generated gas overpressurizes the tube shattering it. Granted most ignitable materials of that type burn much faster if the pressure increases inside a sealed container, but there's still such a limited amount of the ignitable material that the fire would probably be mostly over when the plastic tube shatters. Amateur rocketry materials are federally regulated, and with product liability risks being what they are, a lot of development has gone into making them reasonably safe when used with some degree of responsibility.

I imagine the risk of setting a grass/brush fire, if the device was somehow to be fired after landing, could easily be minimized to an insignificant risk by taking a few simple precautions. Some that immediately come to mind are: 1) a "blast shield" of thin aluminum, maybe even ordinary foil, could be wrapped loosely around the mechanism; and 2) if a flight computer is available instead of just a simple RF command decoder, it could be programmed such that, if a manual fire command isn't received to ignite the cut-down device at altitude, the computer could send a fire command at any time after a sustained period of descent is detected, i.e., after the balloon has burst. Other parameters could be incorporated to initiate an automatic cut down before landing, such as attainment of a desired altitude, or exceeding a preset distance downrange, in other words, the usual reasons for having a cut down device. All would prevent the device from firing after landing.

I wouldn't consider the device to be "too sensitive" as a significantly large amount of energy is still required to fire it. The advantage is that a large battery isn't required to sustain a long period of heating to, say, melt the payload line with a heated nichrome wire. The firing circuit is very similar to "BC" (Battery/Capacitor) flashguns that used to be used to fire one-time flashbulbs for flash photography a few decades ago.

These ignitors are used to fire rockets that, more and more often, have onboard telemetry transmitters and have as much likelihood of being near a 50W mobile rig as an ARHAB balloon does. As always, proper design (shielding, twisted-pair wiring, bypassing, "safing" shunts, etc.) should be a foremost consideration. They should be extremely safe to transport, even in quantity, by keeping the ignitor leads shorted until ready for use, and the whole firing circuit/flight computer setup can be easily tested by putting a 6V low wattage bulb in place of the ignitor and operating the test article in an RF environment similar to what might be encountered at the launch site and in flight.

The author of the article stated he has tested the devices successfully at low temps (-30C) and in a vacuum chamber (unknown value), but the article doesn't state that it has actually been used in flight. Also, since the ends of the shattered tube would likely remain attached to the ends of the flight train line, I wouldn't recommend use in a situation where the severed line end has to pass through something like a ring, although the tube attachment could probably be made smoothly tapered such that the likelihood of catching on a ring or other opening would be very low.

I like the idea that they are extremely lightweight, cheap and easy to make and the materials are available almost anywhere (I think you can even buy the ignitors at Walmart and BIC pen barrels might even serve as the plastic tube for lightweight payloads). The fact that the ignitors are manufactured to a highly controlled degree of repeatability, should make the finished cut down device extremely reliable. I may make some and do some experimenting myself.

The idea may need some fine-tuning, and the first try might not work, but it certainly wouldn't be the first cut down device that I've seen fail the first time it was tried in flight.

Another option, and one I like, is to use 144.39 for both. That way you
don't have to switch between frequencies. This of course assumes that
144.39 isn't too crowded to start with.

I'm sure Mark will chime in here in a second but ...

When you change the shooting mode on a 560, the menus change as well. They will be different for AV, AP, Auto etc. The script is blind and doesn't know about any hardware settings so it just moves up and down through menus the make selections.

If there is an additional menu item and it appears before a selection desired by a script, it will throw off the button presses in the script. So, it is important to use the correct hardware settings to ensure the script will be executing the correct button presses.

I originally used a modified Estes igniter and a pyro cutdown. The stock Estes igniters are VERY unreliable. Electric matches used in Pyrotechnics are much more reliable, but for reasons that Mike has brought to light about the possibility of starting a grass fire or even a house or building fire, I abandoned the idea for an electric nichrome wire cutdown. Much safer!

Gang:
Several years ago, I actually tried to light an electric match with RF. I used 35W UHF, blazing away with the electric match leads spread, dipole style to absorb the RF. We tried every position possible near the whip antenna and eventually got it to light with less than 1" clearance. Several other matches were lit, all with the same very short range requirement.

So, although it is indeed possible to light an electric match with RF, it's really not possible to do it unless you are trying to make it happen.

best

Hi;
I've been looking for a nichrome wire cut-down that actually & truly works and would be interested in a working schematic and/or PCB layout. Unfortunately, all the ones I've built which were originally detailed via Nuts & Volts, or in the Near-Space white papers posted on the parallax web site site have never worked properly.

thanks
Dan (KL1JP)

I originally used a modified Estes igniter and a pyro cutdown. The stock
Estes igniters are VERY unreliable. Electric matches used in Pyrotechnics
are much more reliable, but for reasons that Mike has brought to light
about the possibility of starting a grass fire or even a house or
building fire, I abandoned the idea for an electric nichrome wire cutdown. Much
safer!

The ones we used were the old skool home made types from High powered rockets.

It was a short piece of slow butning un sheathed thermite, attached to a old fashioned flash bulb.

The flash bulb was attached tightly to a spiral wound around the bulb of themite,

the flash too little to no power to go off and when it did it's heat was more than enough to start the thermite, and it has it's own onygen supply so works at any altitude. and the support line was just wrapped several times around the thermite and held in place with any type of tape,

then the whole ting was encased in a blob of fiberglass insulation so even if it should fire on the ground the risk of fire was minimal.

Is that one of my designs you've had a problem with?

My class will be makinig PCBs shortly, I could make a PCB for you to work with. I may also have a cutdown to send you with a digital stop watch attached. It's been flown twice.

Hi Paul;

Actually, yes it was. I copied your original schematic but never could get it to work. I'll absolutely take you up on your offer. I'd love to have a working pcb together with an attached stopwatch (if you can find that too) so I can see how these cut-downs are suppose to work. US Mail works the best up here.

Interesting idea below about thermite. I wonder if anyone has experimented with those very small legacy flashbulbs. I think they were about 1/2 inch and composed of heavy duty plastic. Cut the top off of the flashbulb and ignite it with a short 6V change. Upon firing, I remember them generating enough heat to melt and expand the plastic top.

Thanks very MUCH for your offer of help.

cheers

Many years ago I visited NOAA in Bolder where they had an exhibit of their long duration balloon equipment. This setup was to stay up as long as possible and go wherever the winds took it. They could not get permission to overfly all of the countries in the northern hemisphere so they had a sensor that detected the tilt of the earths magnetic field. If the tilt indicated they were in the northern hemisphere an scr was fired that heated up a standard 1/2 watt carbon comp resistor. The support lines for the package were monofilament fishing line tied around the resistor. Heating the resistor melted the lines.
The overall construction of the electronics was also quite interesting. They used very thin PCB material for the circuits which were then rolled up inside styrofoam tubes.Jim Hannon

Upon firing, I remember them generating enough heat to melt and expand the plastic top.

Most of the old flash bulbs were composed of fine gauge Magnesium wire
in an Oxygen atmosphere (Later, Zirconium was substituted for the
Magnesium.). The envelope consists of glass, with a plastic cover. The
plastic cover serves two purposes. The first purpose is that it prevents
glass shards from being thrown out if the bulb happens to shatter during
firing. The second is that it improves the colour balance of the bulb.

http://en.wikipedia.org/wiki/Flash_photography#Flash_bulbs

The problem, though, is that it's getting very difficult to find flash bulbs
now. According to my information, there's only one company that still
makes flash bulbs, and they're located in Ireland (Meggaflash), and their
products aren't cheap. There are still some NOS bulbs available, but
the prices have went up over the years.

Hi Harry and Mike,

Please provide more details.

In what way were the Estes igniters unreliable? And how did you use them? Sealed in a tube like the idea in the link I provided? Or did you just attach them directly to the load line? What about the ideas I advanced concerning mitigating the fire hazard? I'm not trying to start a flame war, just trying to engage in a little intelligent discourse.

Sorry, but if inventors just gave up whenever someone else said "don't bother, it won't work" without giving any evidence of "why not," we'd all still be traveling overseas in wooden sailing ships. Judging from posts to this forum, electric nichrome wire cutdown devices apparently aren't entirely reliable either, and e-matches aren't so sensitive to RF, so maybe the pyro cutdown idea still deserves some consideration.

You don't think a little shielding would obviate the chance of starting a grass fire? Or assuring it gets fired at altitude via a timer or flight computer? As for a house or building fire, come on now -- give me a break! Maybe if an unshielded e-match went off in very DRY grass, and if the grass set some brush on fire and if the brush set a forest on fire and if the forest set the house on fire. Lots of if's. And easily avoided (shield the device, don't fly it when the area is ripe for brush fires and make sure the flight computer attempts to fire it several times at altitude). Maybe it'd be a difficult call for some areas of the country (that probably should never have even been populated in the first place), but it'd be safer than smoking I'd think.

The thread describing the use of a ball of thermite gobbed onto an opened up flashbulb sounds truly scary. I can see something like that setting off a fire even in a steel mill. I ran across a link for a source of AG1 flashbulbs (jellybean sized), but I won't include it here to avoid what seems to me to be an irresponsible use of them. Besides, they're expensive

now, even more so than e-matches.

I can see why Estes igniters would be fragile and unreliable (as to whether or not it fires reliably). The bridgewire seems to be very short and unsupported by anything more than a piece of tape across the leads and the pyrogen coating. Any flexure of the bridgewire could cause the pyrogen to crack and break the wire. If I remember correctly Estes uses a considerably heavier bridgewire than do most e-matches, requiring more current for a longer period of time to fire them. This would make the balloon-borne firing circuit heavier. Here's a drawing from Estes:

> http://www.esteseducator.com/content/igniter.php

Other brands of amateur rocketry igniters (Quest for example) seem to be only slightly better made. I'd hoped they would be better made by now, but I suspect most really serious rocketeers use DIY e-matches.

Even so, if you put one of the Estes igniters inside a plastic tube (carefully -- and possibly add a little more pyro material in with it), epoxy the ends of the tube, then test the continuity of the igniter with a low current ohmeter after the epoxy sets, I'd think the tube and epoxy would provide good protection of the igniter, insuring that the bridgewire doesn't flex and break in use. So I suspect the idea of using an Estes igniter in a cutdown device still has some possibilities.

However, upon closer examination of the photo in the link I originally provided, it is clearly apparent the UK guy used an electric match, and I believe this would be the way to go. You can see the dark pyrogen at the left end of the match and the uncoated part of the chip where the shooters wire is soldered to the right. That link again:

> http://wiki.ukhas.org.uk/ideas:flight_support#pyrotechnic_cutdown_device

AFAIK you have to have a BATFE permit to purchase finished e-matches, but you can buy the unfinished materials (three containers of chemicals to mix to make a pyrogen dip and the match chips with pre-soldered bridgewires) to make your own without a permit or hazmat shipping costs and difficulties.

Making DIY e-matches would also have the advantage of allowing them to be made with just the right amount of pyrogen on each match to generate sufficient gas to insure the tube shatters reliably but avoiding making a device that could be a significant fire hazard. Unfortunately it isn't exactly inexpensive to go that route to make up a few to test to prove a point. The kits would cost about $65+ plus shipping, but that would make 50 e-matches with a lot of pyrogen left over. So, the cost is very reasonable if they work as a cutdown device, and if you're making them to use fairly frequently, but not just for a one-off test. The links:

> http://www.aeroconsystems.com/electronics/nichrome.htm#hothead
> http://www.aeroconsystems.com/electronics/electric%20match%20making/matchmaking.htm
> http://www.skylighter.com/mall/ignition.asp#GN5051

E-matches are also manufactured in a way that provides for repeatable min and max fire current and resistance characteristics, allowing for safe pre-flight testing for continuity and shorts.

I once had an idea for a lightweight, purely mechanical release utilizing a toggle mechanism to greatly reduce the energy required to cause it to release, but it would've been tedious to produce it in a home workshop. This "e-match in a sealed tube" idea seems like a much easier thing to refine and reproduce.

Jason KG4WSV came up with a mechanical release utilizing a slightly modified bow release that seemed to pretty much duplicate my toggle mechanism idea, and it has the advantage of being something you can buy off the shelf. So I never got past the point of making a large-scale cardboard model of my mechanism.

If you want to discuss this topic more thoroughly but would prefer to take it off-list, that'd be OK with me.

It was not an opened flashbulb, and the thermite is standard issue for
high power rocket ignighters around here as well as using the flash bulb
to ignite it.

The thermite it wrapped a few times around the bulb, and tapped tight,
the payload line then is wrapped around a stub of the thermite left over
(couple inches)

and thats it, it is then wrapped in some plain fiberglass.

When used I wouldn't even think twice about holding it in my hand, if it
wasn't for a bit of smoke that escaped the fiberglass, you'd never even
know anything happened. it doesn't even get a detectable amount of
warmth at all.

if anything it's far safer than some of the bare systems I have been
seeing here so far.

Joe

Hi Barry,

Just to give you some background on me so you understand where my comments come from. I was a Firefighter for 27 years, I was involved in High Power Rocketry, I worked in pyrotechnics for many years in the development of formularies and Class A,B & C explosive devices for fireworks displays.

If you decide to pursue the pyro cutdown and acquiring materials I would strongly suggest checking your local, state & federal regulations. Although it may be legal to make devices, more than likely you will run into regulations regarding the storage and transportation of such. You should also acquire some education on pyrotechnics both for you and your families safety. To many "backyard pyros" have suffered from their lack of education.

I won't discuss the how-to's of pyro on the web. There are legal ramifications that I choose to avoid!

Estes igniters are unreliable in the fact that they are very cheaply made and are fragile. Anyone that has ever launched model rockets can tell you how many times Estes igniters fail.

The nichrome device is much more reliable. I use it from one flight to the next with no more prep than running the load line back through the nichrome coil. No muss no fuss!

Mike has come up with a really great mechanical device for cutdown. It is very reliable! Your turn Mike... :)

Barry N4MSJ,

I have had good luck using the defy gravity teher as a cut down device. It works just as well at 90K for a balloon as it does in my rocket at 6K.

Anyone who's tried to "serve" the end of a nylon line using a lighter
knows that nylon sustains a flame quite nicely once ignited, and that
flame will propagate down the line. It's safer to melt the line at
a temperature well below the ignition point using the NiCr coil that's
worked so well for many of us.

Guys, all I'm asking for here is an intelligent discourse on this subject with constructive criticism of REAL problems, and maybe even a bit of open-mindedness as well (you know, like real scientists do). Are you interested in doing that?

Can I contribute to such a discourse? I think so. I've lived and ENGINEERED in Huntsville, Alabama for over 40 years and we *DO* know a little bit about rockets and space here. In fact, I can honestly say that I "lit the fuses" for the biggest damn rockets you've ever seen, and if you've lived on this planet for a few years I'm sure you've seen them on TV.

It almost sounds as if you didn't pay a lot of attention to how the UK guy's pyro cutdown device actually works. I'll describe it once more: A very small pyro device (minimally coated e-match) is sealed inside a very short piece of a hard plastic tube that is sealed at both ends. The pyro fires, generating a small amount of gas that, because of the very small volume inside the tube, quickly overpressurizes it and shatters the tube. The load line is not continuous. It is in two pieces attached to the ends of the tube which serves as a link between the two pieces until the link is shattered by the pyro charge.

The nylon cord isn't inside the chamber where the pyro burns, and the cord doesn't have to be anywhere near the device at all. You could keep it entirely separate with a short wire link if you're really all that worried about it.

If the tube itself were to ignite, I suspect the sudden release of the pent-up gases would "blow" any remaining flame out. Even so, I'd probably loosely wrap the whole thing in a non-flammable material, such as fiberglass insulation or even a couple layers of aluminum foil.

Finally, nylon cord really doesn't burn all that well. I just did some trials to confirm my recollection about my experiences with serving nylon cord. I tried it with three sizes from very light cord (about 1/16") to

fairly heavy (about 3/16"). I held the end of the cord in the hottest part of the flame of a propane torch a second or two. It melted and looked like it might be burning. I took it out of the torch flame, it had flame on the melted ball of nylon but then the flame went out in less than a second.

I held it in the flame longer, maybe five seconds. It did burn for 3 or 4 more seconds and a drop of melted nylon dripped from it, then the cord went out. The drop was flaming when it started to fall, but that went out before it hit the bench top that was about 6" inches below the cord.

I tried several variations to try to get more prolonged flame. It takes quite a bit of effort to get the flame started, and even then the least little thing will cause it to go out. I really thought I had it going for good one time, but after it dripped 4 times it went out. In fact, the dripping of the molten nylon often removes enough heat from the fire to put it out.

If you hold it vertically, a method frequently used to test for flammability of materials, you can achieve a sustained flame, but that means VERY vertical as the flame has to envelope the cord to pre-heat the cord above the actual flame. Often the tendency of the unweighted cord to curl up on itself is enough to keep it from being vertical. Even then there's a tendency for dripping nylon to remove enough heat to make the flame very tenuous.

Now, I've also used another type of cord that if memory serves, burned a bit more vociferously. I think it was a linear polypropylene cord covered by a braided nylon jacket. It might be best to avoid that kind.

If you really want to flog this dead horse some more, I might suggest you look into flame retardant solutions that fabrics and cords can be dipped into.

But let's face it. We're grasping at straws here. The chances of this incredible string of malfunctions (and really bad luck) setting a fire of any consequence is starting to look like much less of a risk than that of conking some innocent citizen on the head with your falling payload. And it even requires some really bad engineering to boot.

In recent posts I've stated over and over several things that can be done to insure that the cutdown device never fires anywhere near the ground, and how to shield it even if it did. Yet all this seems to have been completely ignored in order to perpetuate this "danger" of a hypothetical ground fire. As far as I'm concerned this line of casting doubt has run its course to the point of being absolutely ludicrous.

Is there a risk? Sure. There's ALWAYS some risk in every action (or even inaction) that one does. But is it realistic? I don't think so.

BTW, I think you're also wildly over-pessimistic regarding the risk of inadvertent ignition of the e-match by RF. This seems to be supported by Mark's tests as well. To wit (8/17/2009):

> Gang:
>
> Several years ago, I actually tried to light an electric match with RF.
> I used 35W UHF, blazing away with the electric match leads spread,
> dipole style to absorb the RF. We tried every position possible near

> happen.
>
> best
>
> - Mark ng0x
>

So, are we done with the exaggerated dangers and desperate attempts of justification? Do you have anything positive to contribute? Can we get over this pissing contest and steer this discussion in a more constructive direction?

In the spirit of cooperation, I'll start things off: I was thinking that the plastic tube needs to be hard but not extremely "tough." It has to be strong enough to stay intact while supporting the weight of the payload train, but it also has to shatter and not just split open, or worse yet, contain and withstand the gas pressure. So, I'd think you'd want something stronger than, say, polystyrene but not as tough as Lexan (polycarbonate) nor as soft or flexible as nylon or vinyl. What's in between? One thing I don't know a whole lot about is plastics. The first thing that comes to mind is Plexiglas (acrylic PMMA), but maybe a thermosetting plastic would be better. Maybe phenolic (without embedded fabric). I doubt you'd have to worry about phenolic catching fire at least, but plexiglas tube would probably be easier to find.

Ballooning can always use another reliable cutdown device.

Thanks for that link, Nick. The Tether is an interesting device, and I enjoyed watching the movie of it firing, in fact I re-watched it several times. I have to admit that at first I thought the metallic colored link with the two large holes was one part, and I couldn't at first see how anything would get separated. Then I saw a view that showed that it was actually two pieces, and I had that "Aha!" moment. BTW I've used those rubber blind fastener devices (that seals the backside of the combustion cup) for attaching padeyes to parts of my kayak where I can't get to the back side. I was trying to remember what the "official" name was of that rubber thing (like what you'd ask for if you wanted to go to a fastener dealer to buy one), but it escapes me at the moment.

I'm mostly looking into this plastic tube cutdown device as a mental exercise. Although trained as an electrical engineer, I realized early in my life that I seemed to have a knack with mechanical gadgets as well, so I enjoy inventing things, and feel that a brain that's exercised is a brain that grows stronger. That's why I may continue to pursue the idea even though I probably won't ever use one myself. Even though there are other solutions to the problem, it never hurts to continue to think up new ways to do the job.

I haven't heard anything yet and wanted to make sure my message got out.

We're looking for a host for GPSL 2010. We can get a poly balloon demo in 2010 and it's recommended we launch in the weat Texas, east New Mexico region because of the lack of air traffic.

Is anyone interested in hosting GPSL 2010? What if it was held elsewhere?

I doubt I will be ablet to participate in a Texas-based GPSL. A
little too far and too much of a corresponding time commitment to make
that drive.

Overall, west Texas may be more suitable for the recoveries most of us
are used to. Lots of dense woods in east Texas. I like those
three-minute hikes to get to the payload. West Texas may be more of a
hike from the road, but shouldn't require a chainsaw.

I'm willing to host again in Hutch if people want to venture back for a 3rd time. We don't have much in the way of exciting manufacturing around here, but we could formalize something at the Cosmosphere.

As for Texas, I'm trying to keep my options open, but I'm not sure if I'd be able to make that either - it would just depend on when the date fell.

A launch from E NM with strong upper easterlies could put payloads down
in an Indian reservation, which could make for recovery difficulties.
ANSR has run into this before.

Thanks for the description of the UK's release device. It sounds more like an explosive than a pyrotechnic device, which would certainly present a negligible risk of fire. In fact, I built and successfully flew a similar device on EOSS-5. It used 1 gram(?) of shotgun powder inside a horizontal brass tube with two snug-fitting dowels closing off each end and extending past the ends of the tube far enough to tie on a Y-harness going up to the balloon, and the center of the tube was secured to the top of the parachute. The powder was ignited using an Estes rocket ignitor. Despite having demonstrated it at arms length at a meeting, the EOSS membership vetoed the scheme as more dangerous than the NiCr line melter.

Harry's got a video of his rocket-fuel based pyro release, and it clearly emits a brief visible flame that could ignite bone-dry field grasses that have characterized our landing sites up until this rather wet summer. Maybe he could send you the .wmv?

I'm willing to host again in Hutch if people want to venture back for a 3rd time.? We don't have much in the way of exciting manufacturing around here, but we could formalize something at the Cosmosphere.

As for Texas, I'm trying to keep my options open, but I'm not sure if I'd be able to make that either - it would just depend on when the date fell.

Zack,

We'd be pleased to come to Hutch again. Always had a great time and another trip through the Cosmosphere would sit fine with a number of us. The Texas trip was a bit long for us too.

2011 works for us in Omaha I think. I think we would target July 7-10 unless people wanted to consider June 30-July 3 (the 4th is a Monday in 2011).

Our Thursday afternoon event would likely be the Strategic Air and Space Museum (formerly the SAC Museum) near Ashland, about halfway between Lincoln and Omaha just off I-80. For a group of >20, we can get reduced admission and a guided tour.

I think it's important to stay away from the 4th of July weekend for GPSL, later in July seems to work very well for most of us. That's my $.02 worth anyway....

I hope to make both events. Hutchinson and Omaha are reasonable distances from western Indiana. July weekends are generally good. Space Jam 4 with the Scouts will be in August next year.

Haven't had a Santa Fe trail rut fix since 1994.

Hi Zack,

I will start putting together the 2010 GPSL page asap. It will be your page but I'll do the editing if you don't mind. Please take a look at the 2009 version (superlaunch.org) let me know what you like what you don't etc. and I'll make changes.

Mostly I need info about the local, choice of launch sites, dinner sites, hotels and so on. But hey, this event is almost a year out so take your time, think about things and we'll move forward slowly.

5987. Balloon Launch for KU

Yahoo group: GPSL (2009 — 2010)
Date: 2009-08-25 03:58:57 UTC
From: L. Paul Verhage
Topic: 5987 Message: 5987

I'm a student teacher in CT442 this semester (to get my PhD, I need a college teaching experience). My prof has asked I have the students do an inquiry unit involving BalloonSats. Is anyone in the Lawrence area interested in helping out with a launch in mid to late September? Is anyone in the area planning a launch that might also have some weight available?

Thanks

From: L. Paul Verhage
Topic: 5988 Message: 5988

In the US, 144.390 is the standard frequency for APRS. In Europe it's 144.800. I see Byonics only sells a 144.800 model of their MicroTrak 300. Is there a reason we can't fly on 144.800? I know it's not I-gated, but is there any other reason? I've been looking for a band plan, but so far, I haven't found one for APRS online (I'll keep looking through).

Hi Paul,
The ARRL Rptr Handbook says FM repeater inputs are from 144.600-144.900.

Topic: 5988 Message: 5990

As Harry said, 144.800 is a repeater input, specifically for 145.400.
If you Google "145.400 repeater" you'll find a (lengthy) list of
users.

I believe the MicroTrak now comes in a frequency-agile package which
can be programmed. Also, you can get the SRB MX146 transmitter from
https://www.argentdata.com/catalog/product_info.php?cPath=25&products_id=81,
which can have its frequency set by an I2C or SPI interface. This
might be good for a setup where you have your main output on a non-.39
frequency with lots of data and put out once-per-minute updates on
.39.

5991. Re: [GPSL] Radar Reflector ? (and a neat idea for a cut-down device as well)

Yahoo group: GPSL (2009 — 2010)
Date: 2009-08-30 04:48:31 UTC
From: Mike Manes
Topic: 5939 Message: 5991

Apologies for the LDR (long delayed reply) - been regaling in a surge of productivity fueled by a steadfast refusal to turn on this bloody time thief except every 3 days.

Thanks for the comment about the fast release. One of the nice benefits is the utter simplicity of flight prep: just tie on a new lift ring to the lift line to the balloon and clip it into the release. Period. The only time a burner needs to be refit and burner batteries consumed is in the event that the backup release is fired, e.g., to avoid an undesirable landing site or in the rare event of a floater. So far, only once in 30 flights with the fast release to date.

The bad news is that our plans to get out CAD drawings and CAM parts have stalled. Anyone know of a cheap and user-friendly 2D mechanical drafting app - i.e., NOT AutoCAD?

I use DesignCAD quite a bit. You can pick those up on their website for $50, and eBay used to be cheaper than that.

It's somewhat different that AC, but very intuitive (assuming you have *any*CAD experience).

5993. RE: [GPSL] APRS VHF Frequency

Yahoo group: GPSL (2009 — 2010)
Date: 2009-08-30 17:00:16 UTC
From: Nick Hanks
Topic: 5988 Message: 5993

Last winter EOSS had a tentative 3-fer on the schedule for this summer. We needed another frequency to cover our APRS and CW beacons. (BTW the 3-fer turned into a 2-fer.) I contacted a friend who is our Colorado ARRL Section Technical Coordinator for his thoughts on a frequency to use. Our tech coordinator is Bob Witte, K0NR. Some of you may know Bob as one of Joe Lynch's columnist in CQ VHF.

I contacted Bob Friday (Aug. 28th) about sending his response to my questions to the GPSL reflector. He wrote back:

"Put a big disclaimer at the top that this email is in the CONTEXT OF COLORADO. The problem with VHF band plans is they are local and they actually vary quite a bit from state to state (more than you would expect). So I would expect to hear someone say "that's not the frequencies we use in Texas" or whatever."

So take heed that this data in relation to flights in Colorado, but I think it may be useful in looking for a new APRS frequency. Here's the summary of our email exchange with Bob's thoughts in blue and mine comments in black.

"1. Something near 144.44 MHz (like 144.44 maybe).

2. A simplex frequency such as 147.42 MHz (I've started scanning the 147.200 - 147.570 band looking for ECHOLINK traffic per Bob's response. Maybe someone with better listening conditions (i.e., not behind the hogback) could do the same.)

3. A frequency in the Misc/Experimental band as long as you stay away from 145.80 MHz. Candidate would be 145.650 MHz, but maybe on a different flight string if our longtime EOSS favorite of 145.600 MHz was also in use. (We could start scanning this band 145.500 - 145.800 MHz too looking for high-use traffic.)"

I should note that at a earlier GPSL (in 2002 I think) EOSS received a bit of push back on the use 147.555 MHz in Kansas as it's used as a skywarn altering frequency. I tried to find a 2m band plan for Kansas to see if this was still used, but couldn't find a plan on the web.

Below is a lightly edited, full version of our question and Bob's response (font colors the same).

73,

Nick

N0LP

EOSS

Again please note this data is context of balloon flights in Colorado.

Hi Nick,
Good to hear from you.

Just to be clear, I'll put out the disclaimer that I don't assign frequencies for specific uses. But I think you know that and are just looking for some advice on this.

Further comments below.

Hi Bob,

Edge of Space Sciences (EOSS) is looking for two frequencies on which to operate an APRS transmitter and a CW beacon during a flight next summer. This flight is a bit different in that there will be three balloons in the air at one time. We need frequencies for our APRS beacons and our CW beacons. We routinely use three 2m frequencies on our flights (144.34 for APRS position data, 145.600 for APRS or a CW ID beacon, and 147.555 for CW ID beacons). The CW ID beacon transmits a tone for 30 seconds and its ID in CW and then is silent. This is used to DF the location of the balloon should the APRS module fail. We've used these frequencies for a number of years without any difficulties. We need two more frequencies to support the 3-fer flight as we share the 144.34 freq between two of the APRS beacons by time-slotting their transmissions.

A survey on the ARRL 2m band plan and the AMSAT frequency usage (http://www.amsat.org/amsat-new/satellites/frequencies.php) shows the following possible frequencies we could use.

144.44 MHz This frequency is in the "New OSCAR Subband" in the ARRL band plan. This would be 5 kHz above the national APRS freq of 144.39 and 5 kHz below the AMSAT 144.49 freq for International Space Station (ISS) crew uplink and imaging. The AMSAT website labels this freq "semi-operational." A little calculation shows a maximum Doppler shift of 3.7 kHz for the ISS at 200 nm and the downlink frequency of 144.90 so there would a 1.3 kHz of space between the 144.44 and the 149.49 AMSAT freq during a pass. This possible conflict would be moot if: 1) the frequency is not in use (a reference to its "semi operational" status), 2) we not use the frequency during an ISS pass over the flight area, or 3) we accept that the CW beacon at one watt into a vertical J-pole would not have sufficient EIRP to break the squelch of the ISS receiver when the ISS is at low elevation angles (close to or raising above the horizon) when the Doppler would be at its maximum and range to the ISS at its maximum. I think 144.44 MHz is 50 kHz above the APRS frequency of 144.39 MHz, not 5 kHz. (My typo. nh) You could probably tighten that up and use something like 144.39 + 0.030 MHz = 144.42 MHz. This has you 70 kHz below the ISS uplink which is plenty. It turns out that this OSCAR subband is not available for satellite use in all parts of the world, so basically no one wants to put a satellite on the air in this band. Probably a safe place to play with balloons (except for the APRS frequency on 144.39 MHz).

147.425 MHz This frequency is in the upper of the two simplex subbands of the ARRL band plan. This is the same subband as the 147.555 frequency we currently use. In either 2001 or 2002 during an amateur radio balloon conference in Kansas we found that 147.555 is used as a call up frequency for a storm tracking net. We used the 147.555 frequency in Colorado regularly and in Aug. of this year just east of Kansas City, MO with no adverse effects. Its use would give us 125 kHz of separation between the two balloons so mutual interference should be minimal. The ARRL band plan is quite general to cover the entire US. VHF band planning is really local, so a better place to look is the CCARC 2M band plan at (CCARC is the Colorado Council of Amateur Radio Clubs)

http://www.ccarc.net/images/CCARC_FUP_144MHz_revB.pdf
You'll see that the appropriate simplex frequency is actually 147.420 MHz as the band plan is laid out on 15 kHz channel spacing. In general, the simplex frequencies in the 147 MHz range are lightly used and you could just pick one. Sometimes there are Echolink nodes running on these frequencies which could be a major conflict. (I'll start scanning the subband for Echolink traffic.)

145.800 MHz This frequency is the top edge of the Miscellaneous and Experimental Modes subband of the ARRL band plan. This is the same subband as our currently used 145.600. The frequencies would be separated by 200 kHz and used on separate balloons so mutual interference should be minimal. This is the downlink of the ISS station, so that frequency is a real problem. (Underline is mine. nh) You could slide down a bit....maybe to 145.650 MHz or so and still be in the Misc/Experimental subband. The 145.650 MHz may be too close to the 145.600 freq for two payloads on the same string, but would probably be okay for use with two or more flight strings.

146.400 MHz This frequency is the bottom edge of the lower of the two Simplex Subbands in the ARRL band plan. It is 155 kHz above the frequency (146.55) EOSS uses for simplex communications at the launch site and between the track and recovery team members. Believe 155 kHz should be sufficient separation between the two. It's also 120 kHz below the national calling frequency of 146.52 which again should be sufficient separation. This might work. I have heard significant simplex activity down on 146.40, 146.43, 146.46 MHz etc. So the risk is that you conflict with "Ernie and Joe's Favorite Simplex Frequency". I'd choose the 147 MHz simplex frequencies over these....typically less activity.

In summary, I think you could choose two frequencies from this list:

1. Something near 144.44 MHz
2. A simplex frequency such as 147.42 MHz
3. A frequency in the Misc/Experimental band as long as you stay away from 145.80 MHz

Your thoughts and suggestions would be welcome.

Thanks for your help.

Nick Hanks

N0LP

I hope this helps. Let me know if you have any further questions at all.

73, Bob K0NR
